learning approaches for a set of visual computing tasks largely due to their utilization in developing new techniques based on sparse representation Compared with conventional techniques employing manually defined dictionaries such as Fourier Transform and Wavelet Transform dictionary learning aims at obtaining a dictionary adaptively from the data so as to support optimal sparse representation of the data In contrast to conventional clustering algorithms like K means where a data point is associated with only one cluster center in a dictionary based representation a data point can be associated with a small set of dictionary atoms Thus dictionary learning provides a more flexible representation of data and may have the potential to capture more relevant features from the original feature space of the data One of the early algorithms for dictionary learning is K SVD In recent years many variations extensions of K SVD and other new algorithms have been proposed with some aiming at adding discriminative capability to the dictionary and some attempting to model the relationship of multiple dictionaries One prominent application of dictionary learning is in the general field of visual computing where long standing challenges have seen promising new solutions based on sparse representation with learned dictionaries With a timely review of recent advances of dictionary learning in visual computing covering the most recent literature with an emphasis on papers after 2008 this book provides a systematic presentation of the general methodologies specific algorithms and examples of applications for those who wish to have a quick start on this subject Neural Information Processing Sabri Arik, Tingwen Huang, Weng Kin Lai, Qingshan Liu, 2015-11-21 The four volume set LNCS 9489 LNCS 9490 LNCS 9491 and LNCS 9492 constitutes the proceedings of the 22nd International Conference on Neural Information Processing ICONIP 2015 held in Istanbul Turkey in November 2015 The 231 full papers presented were carefully reviewed and selected from 375 submissions The 4 volumes represent topical sections containing articles on Learning Algorithms and Classification Systems Artificial Intelligence and Neural Networks Theory Design and Applications Image and Signal Processing and Intelligent Social Networks Handbook of Convex Optimization Methods in Imaging Science Vishal Monga, 2017-10-27 This book covers recent advances in image processing and imaging sciences from an optimization viewpoint especially convex optimization with the goal of designing tractable algorithms Throughout the handbook the authors introduce topics on the most key aspects of image acquisition and processing that are based on the formulation and solution of novel optimization problems The first part includes a review of the mathematical methods and foundations required and covers topics in image quality optimization and assessment The second part of the book discusses concepts in image formation and capture from color imaging to radar and multispectral imaging The third part focuses on sparsity constrained optimization in image processing and vision and includes inverse problems such as image restoration and denoising image classification and recognition and learning based problems pertinent to image understanding Throughout convex optimization techniques are shown to be a critically important mathematical tool for imaging science problems and applied extensively Convex Optimization Methods in Imaging Science is the first book of its kind and will appeal to

undergraduate and graduate students industrial researchers and engineers and those generally interested in computational aspects of modern real world imaging and image processing problems
