

# THE ANATOMY OF MULTIPLE SCLEROSIS

Multiple sclerosis, also known as MS, is a complex condition that affects the central nervous system, which consists of the brain and spinal cord. The brain and spinal cord collectively process and transmit information, coordinating bodily functions and enabling complex behaviours. In MS, the immune system mistakenly attacks protective material around nerve fibres, called myelin, leading to communication issues between the brain and the rest of the body. Over time, MS can cause permanent damage or deterioration of these nerves. The severity and advancement of MS can vary significantly from person to person and can change over time.

## TYPES OF MS

There are three main types of MS. These include:

### RELAPSING-REMITTING MS (RRMS)

The most common type of MS which is characterised by episodes of new or worsening symptoms, also known as relapses, attacks or flare-ups. The symptoms, which may occur without warning or be linked with a period of illness or stress, typically last for a couple of days or weeks. They are often followed by periods of remission, during which the symptoms either fully or partially resolve.

### PRIMARY PROGRESSIVE MS (PPMS)

This involves a steady progression of symptoms without any relapse or remission. However, people may have periods where their condition appears to stabilise, and symptoms remain fixed.

### SECONDARY PROGRESSIVE MS (SPMS)

This stage usually develops after RRMS for many people and is characterised by a gradual, continuous decline in symptoms, without period of relapses. It develops as the body struggles to recover from the cumulative impact of relapses.

MS affects everyone differently. Two people with the same type of MS will not experience symptoms in the same way.

## CAUSES

The exact cause of MS remains unclear, but it's believed to result from a combination of genetic, environmental, and immune system factors, along with possible viral triggers.

Having a family member with MS slightly increases your risk, but having a genetic link. Living further from the equator, with generally lower vitamin D levels, is also associated with a higher risk of developing MS.

As an autoimmune disease, MS involves the immune system attacking the nerves in the brain and spinal cord. Some researchers believe that certain viruses may trigger this response.

## SYMPTOMS

The symptoms of MS can fluctuate with time and often in severity. Common symptoms include:

- Fatigue
- Difficulty with balance and coordination
- Muscle weakness and spasms
- Sensory disturbances, such as numbness and tingling
- Challenges with cognitive function, such as issues with memory, thinking, and learning
- Visual disturbances, such as blurred vision

MS can also cause emotional struggles such as depression or anxiety.

## TREATMENT

Treatment for MS varies based on the type and severity of the condition. Some may only need minimal care, while others require more intensive support.

**Disease-Modifying Therapies** – These medications reduce relapses and slow disease progression.

**Rehabilitation** – Programs including physiotherapy, occupational therapy, and speech therapy help maintain mobility, manage pain, and improve overall function.

**Lifestyle Modifications** – Regular exercise, a balanced diet, stress management, and sufficient sleep can positively influence MS symptoms and overall well-being.

### PERSONALISED SUPPORT IS AVAILABLE

A diverse team of healthcare professionals, including doctors, nurses, physiotherapists, and speech therapists, work with individuals living with MS to provide continuous and personalised support.
