Acta Numerica 1993:

Acta numerica, 1993 Acta Numerica 2013: Arieh Iserles, 2013-07-04 Acta Numerica is an annual publication containing invited survey papers by leading researchers in numerical mathematics and scientific computing The papers present overviews of recent developments in their area and provide state of the art techniques and analysis *Proceedings of the Seventh SIAM Conference on Parallel Processing for Scientific Computing* David H. Bailey, 1995-01-01 Proceedings Parallel Computing *Numerical Simulation of Incompressible Viscous Flow* Roland Glowinski, Tsorng-Whay Pan, 2022-09-20 This book on finite element based computational methods for solving incompressible viscous fluid flow problems shows readers how to apply operator splitting techniques to decouple complicated computational fluid dynamics problems into a sequence of relatively simpler sub problems at each time step such as hemispherical cavity flow cavity flow of an Oldroyd B viscoelastic flow and particle interaction in an Oldroyd B type viscoelastic fluid Efficient and robust numerical methods for solving those resulting simpler sub problems are introduced and discussed Interesting computational results are presented to show the capability of methodologies addressed in the book Parallel Numerical Algorithms David E. Keyes, Ahmed Sameh, V. Venkatakrishnan, 2012-12-06 In this volume designed for computational scientists and engineers working on applications requiring the memories and processing rates of large scale parallelism leading algorithmicists survey their own field defining contributions together with enough historical and bibliographical perspective to permit working one's way to the frontiers This book is distinguished from earlier surveys in parallel numerical algorithms by its extension of coverage beyond core linear algebraic methods into tools more directly associated with partial differential and integral equations though still with an appealing generality and by its focus on practical medium granularity parallelism approachable through traditional programming languages Several of the authors used their invitation to participate as a chance to stand back and create a unified overview which nonspecialists will appreciate *Numerical Mathematics and Advanced Applications* F. Brezzi, A. Buffa, S. Corsaro, A. Murli, 2012-12-06 Scientific computing is a fast growing and fast changing area whose applications to various branches of science engineering medicine economics and others are increasing in number and relevance every day There are two main reasons among others that make scientific computing change so rapidly One is the increasing number of different research areas beginning to make use of numerical simulation from nanotechnology to genomics from computer aided diagnosis and operations in medical applications which involve often complete simulations of parts of the human body to economics and finance Each new application and each new aspect of earlier applications draws heavily on the know how that has been acquired on other problems with similar mathematical features It has to be pointed out that the lofty perspective of mathematics succeeds quite often in finding connections among very different phenomena that turn out in the end to share the same mathematical and numerical structure In turn new applications contribute to the cross fertilization by sending back new interpretations and suggestions which are often useful in more classical applications

All this creates a resonance effect that contributes greatly to the growth rate of the whole field

Numerical Linear Algebra on High-Performance Computers Jack J. Dongarra, Iain S. Duff, Danny C. Sorensen, Henk A. van der Vorst, 1998-01-01 Provides a rapid introduction to the world of vector and parallel processing for these linear algebra applications

A First Course in the Numerical Analysis of Differential Equations A. Iserles, 1996-01-18 Numerical analysis presents different faces to the world For mathematicians it is a bona fide mathematical theory with an applicable flavour For scientists and engineers it is a practical applied subject part of the standard repertoire of modelling techniques For computer scientists it is a theory on the interplay of computer architecture and algorithms for real number calculations The tension between these standpoints is the driving force of this book which presents a rigorous account of the fundamentals of numerical analysis of both ordinary and partial differential equations The point of departure is mathematical but the exposition strives to maintain a balance between theoretical algorithmic and applied aspects of the subject In detail topics covered include numerical solution of ordinary differential equations by multistep and Runge Kutta methods finite difference and finite elements techniques for the Poisson equation a variety of algorithms to solve large sparse algebraic systems methods for parabolic and hyperbolic differential equations and techniques of their analysis The book is accompanied by an appendix that presents brief back up in a number of mathematical topics Dr Iserles concentrates on fundamentals deriving methods from first principles analysing them with a variety of mathematical techniques and occasionally discussing questions of implementation and applications By doing so he is able to lead the reader to theoretical understanding of the subject without neglecting its practical aspects The outcome is a textbook that is mathematically honest and rigorous and provides its target audience with a wide range of skills in both ordinary and partial differential equations

Handbook of Numerical Analysis Philippe G. Ciarlet, Jacques-Louis Lions, 1990 These volumes cover all the major aspects of numerical analysis This particular volume discusses the solution of equations in R^n Gaussian elimination techniques of scientific computer the analysis of multigrid methods wavelet methods and finite volume methods

Solving Sparse Polynomial Systems Birkett T. Huber,1996 Proceedings of the Twenty-sixth Annual ACM Symposium on the Theory of Computing ,1994 *Numerical data and functional relationships in science and technology. Group 7, Biophysics* ,2003 **Proceedings** ,2002 **BIT.** ,2003 *A Family of Preconditioned Iterative Solvers for Sparse Linear Systems* Ulrike Meier Yang,University of Illinois at Urbana-Champaign. Department of Computer Science,1995 Abstract Based on the relationship between the family of Broyden methods and the EN method a new family of iterative methods the family of EN like methods is developed and analyzed These methods are shown to be related to a variety of other known methods which comprise the Broyden methods GCR GMRES Newton s method for approximating the inverse and a combination of a Galerkin step followed by a step of Richardson s method Scaling invariant versions and implementations of higher efficiency are developed and their complexity is examined The convergence of the new methods as well as their restarted and truncated versions are examined Various convergence results are derived which include termination within a finite number of steps and estimates for residuals and errors The methods are also shown to be suitable in the context of inner outer iteration schemes and for two of the methods orthogonality preserving inner outer iteration schemes are developed Adaptive versions which are a combination of truncated and restarted versions and which automatically increase the size of the Krylov subspace are included in the software package PARASPAR which achieves robustness by reevaluating a parametrized preconditioner whenever poor convergence or instability is encountered We present numerical experiments that demonstrate the efficiency of several members of this new family in comparison with other known methods in the context of PARASPAR and in the context of inner outer iteration schemes The experiments show that even though methods like CGS and BiCGSTAB may converge faster for many problems EN like methods are in general more robust since like GMRES they have the option of increasing the size of the Krylov subspace Additionally they often require less memory than GMRES or ORTHOMIN They are also very suitable as iterative solvers inside PARASPAR since they evaluate without additional cost parameters that estimate the quality of the preconditioner Some EN like methods also show drastic divergence when applied to an ill conditioned problem Consequently it is possible to quickly recognize when to reevaluate the preconditioner Finally nonlinear EN like methods are developed and their convergence behavior is investigated

Information Visualization IEEE Computer Society,1999 This volume offers coverage of the 1999 international conference on information visualization Topics include augmented and virtual reality visualization in construction computer aided geometric design design visualization digital art graphical modelling and applied visualization **New Parallel Algorithms for Direct Solution of Linear Equations** C. Siva Ram Murthy,K. N. Balasubramanya Murthy,Srinivas Aluru,2000-10-30 Rather than parallelizing sequential algorithms the authors develop new back substitution free parallel algorithms using a bidirectional elimination technique for the solution of both dense and sparse linear equations They provide full coverage of bidirectional parallel algorithms based on Gaussian elimination LU factorization Householder

reductions and modified Gram Schmidt orthogonalization Givens rotations sparse Cholesky factorization and sparse factorization clearly demonstrating how the bidirectional approach allows for improved speedup numerical stability and efficient implementation on multiprocessor systems Plus the book offers a useful survey of the vast literature on direct methods introductory material on solving systems of linear equations and exercises It is an invaluable resource for computer scientists researchers in parallel linear algebra and anyone with an interest in parallel programming BOOK JACKET
