Active Learning In Science:

Active Learning in College Science Joel J. Mintzes, Emily M. Walter, 2020-02-23 This book explores evidence based practice in college science teaching It is grounded in disciplinary education research by practicing scientists who have chosen to take Wieman's 2014 challenge seriously and to investigate claims about the efficacy of alternative strategies in college science teaching In editing this book we have chosen to showcase outstanding cases of exemplary practice supported by solid evidence and to include practitioners who offer models of teaching and learning that meet the high standards of the scientific disciplines Our intention is to let these distinguished scientists speak for themselves and to offer authentic guidance to those who seek models of excellence Our primary audience consists of the thousands of dedicated faculty and graduate students who teach undergraduate science at community and technical colleges 4 year liberal arts institutions comprehensive regional campuses and flagship research universities In keeping with Wieman's challenge our primary focus has been on identifying classroom practices that encourage and support meaningful learning and conceptual understanding in the natural sciences The content is structured as follows after an Introduction based on Constructivist Learning Theory Section I the practices we explore are Eliciting Ideas and Encouraging Reflection Section II Using Clickers to Engage Students Section III Supporting Peer Interaction through Small Group Activities Section IV Restructuring Curriculum and Instruction Section V Rethinking the Physical Environment Section VI Enhancing Understanding with Technology Section VII and Assessing Understanding Section VIII The book's final section IX is devoted to Professional Issues facing college and university faculty who choose to adopt active learning in their courses The common feature underlying all of the strategies described in this book is their emphasis on actively engaging students who seek to make sense of natural objects and events Many of the strategies we highlight emerge from a constructivist view of learning that has gained widespread acceptance in recent years In this view learners make sense of the world by forging connections between new ideas and those that are part of their existing knowledge base For most students that knowledge base is riddled with a host of naive notions misconceptions and alternative conceptions they have acquired throughout their lives To a considerable extent the job of the teacher is to coax out these ideas to help students understand how their ideas differ from the scientifically accepted view to assist as students restructure and reconcile their newly acquired knowledge and to provide opportunities for students to evaluate what they have learned and apply it in novel circumstances Clearly this prescription demands far more than most college and university scientists have been prepared for

Active Learning in Secondary and College Science Classrooms Joel Michael, Harold I. Modell, 2003-10-17 The working model for helping the learner to learn presented in this book is relevant to any teaching context but the focus here is on teaching in secondary and college science classrooms Specifically the goals of the text are to help secondary and college level science faculty examine and redefine their roles in the classroom define for science teachers a framework for thinking about active learning and the creation of an active

learning environment and provide them with the assistance they need to begin building successful active learning environments in their classrooms Active Learning in Secondary and College Science Classrooms A Working Model for Helping the Learner to Learn is motivated by fundamental changes in education in response to perceptions that students are not adequately acquiring the knowledge and skills necessary to meet current educational and economic goals The premise of this book is that active learning offers a highly effective approach to meeting the mandate for increased student knowledge skills and performance It is a valuable resource for all teacher trainers in science education and high school and college science teachers

Understanding the Utility of Active Learning by Conducting Science to Teach Science Abigail Rose Wilson, 2018 To retain students in science technology engineering and mathematics STEM various pedagogical techniques such as active learning have been incorporated in STEM courses Despite the popularity of active learning it has rarely been empirically tested with a comparison or control group To compare the benefits of active learning to conventional lecture learning the aims of this project were twofold conduct a physiological research project investigating thermoregulation in large ruminants and evaluate the effectiveness of active learning tools for an undergraduate course that focused on core concepts in physiology Physiological concepts from the thermoregulation study were integrated into the educational portion of the study Holstein heifers were used as the model organism for the thermoregulation study Initially 8 heifers were fitted with indwelling jugular catheters and serial blood samples were collected at 3 minute intervals during exercise of increasing intensity Blood lactate was then measured and it was determined that the lactate threshold of Holstein heifers occurs on average at a heart rate of 145bpm 7 7 and at an exercise speed of 6 44km h 0 3 The results from the lactate threshold test were used to design two 8 week exercise trials with the objective to examine the effects of exercise on heat stress using high intensity short bouts of exercise above the lactate threshold low intensity relatively long bouts of exercise below the lactate threshold and sedentary control treatments No differences were found in weekly skin temperatures or core body temperatures p 05 Expression of lactate dehydrogenase A in skeletal muscle cells decreased in the high intensity treatment p 03 Expression of lactate dehydrogenase B in skeletal muscles decreased in the high intensity p 02 and sedentary control p 02 treatments Skin and core body temperatures from all treatments were correlated with THI p 0 001 There were no differences in body weight body condition score or conception rate between treatments p 05 Although not significant p 05 after low intensity exercise training skin temperatures increased while core body temperatures decreased Trends from this study warrant further investigation on the effects of low intensity exercise on thermoregulation in Holstein cattle The second component of this project involved the incorporation of core physiological concepts from the thermoregulation project in conjunction with those identified by the American Physiological Society into an educational study where the utility of active learning for teaching difficult concepts within an undergraduate physiology course was investigated Using a design based research approach two distinct pedagogical tools were developed an active learning tool in the form of a case study and a

conventional lecture It was hypothesized that compared to a conventional lecture students receiving the active learning tool would perform significantly better on tests measuring their ability to comprehend apply and transfer the information to novel scenarios Results from this project did not support the hypothesis but instead led to the question of is it the method or is it the student Prior knowledge of students was evaluated using a physiology knowledge assessment Students with low prior knowledge had greater learning gains from the use of a conventional lecture while students with high prior knowledge had greater learning gains from the use of a case study Students with fewer college credit hours completed and those with lower ACT scores had larger learning gains after receiving a conventional lecture compared to the use of a case study Students with more college credit hours completed and those with higher ACT scores had larger learning gains from the use of a case study compared to receiving the information from a conventional lecture Furthermore students who relied on memorization for learning new information benefitted more from a conventional lecture while students who relied on elaboration for learning new information benefitted more from a case study Thus the success of active learning likely depends on specific student characteristics A one size fits all approach to teaching and learning will not suffice we must first consider the population of students and then select the proper instructional approach

How Students Experience Active and Passive Learning in Science Class Mercer Barrows III, 2019 As authors Bigelow Harvey Karp and Miller 2004 explain part of social justice in the classroom includes a participatory and experiential environment and to not provide that would be socially unjust Therefore I wanted to figure out how I can engage students in a way of learning that supports deeper learning thinking and engagement by implementing active learning instructional strategies Why active learning instruction As Minhas 2012 studied direct instruction is significantly less effective for student s learning and engagement and active learning instruction is shown to produce significant learning gains and engagement Therefore my research investigates How can I can the students in my physics classes to engage in active learning In order to arrive at a solution I needed to understand how my students were currently experiencing learning in science class To guide this investigation I answered these subquestions How are students experiencing learning through direct instruction How are students experiencing learning through active learning instruction

And when do students participate in science class The results are as follows students want some initial direct instruction and find most of the strategies very helpful students find most active learning strategies very helpful after some direct instruction and students prefer to participate in small groups and not during whole class discussions

Launching Learners in Science, PreK-5 Kerry C. Williams,George E. Veomett,2014-09-02 The only way to teach science is to do science The combination of teaching and doing involves three elements knowing content teachers knowing and understanding themselves as teachers and learners and most importantly knowing children Kerry C Williams and George E Veomett describe principles and requirements that reflect the National Science Education Standards for the active learning of science They brilliantly identify key ingredients for primary students and outline the best course of action to aid their development as young scientists Using research on cognitive and neural development and motivational theory from the work of Piaget and Vygotsky this is an invaluable tool for teachers inexperienced in science It will help you discover new ways to think about science and develop lessons that are rich fun and authentic for both you and your students All educators will find examples questions stories and thought provoking ideas to give students a strong start in science achievement plus Six key elements to build into science instruction observing representing organizing patterning and questioning experimenting and sharing How to s for incorporating inquiry workshops centers and projects in primary and elementary classrooms A four step system choice planning doing reviewing that helps promote learning in science and across all subjects
