Sudden Death H.E. Kulbertus, Hein J.J. Wellens, 2012-12-06 Over the last ten years it has become increasingly obvious that sudden death represents the major challenge confronting cardiology in the last part of the XXth Century Careful epidemiologic studies have established the magnitude of this overall important problem of public health The frequent association of sudden death with coronary artery disease has been demonstrated Some of the electrophysiologic mechanisms underlying lethal arrhythmias have been unveiled In addition clinical markers permitting identification of high risk individuals have emerged Finally different studies have raised some hope as to the ability of therapeutic interventions to protect these patients against a premature and possibly evitable demise Over the years a sizable amount of new and relevant information both basic and clinical has become available We felt therefore that a conference on sudden death might be timely It was decided to organize a small gathering during which experts from different disciplines in cardiology could sit together in a quiet retreat to share their knowledge and discuss issues pertaining to research and therapy that might be of benefit to patients The conference was held in Liege on May 7 8 and 9 1979 This three day meeting in which representatives from seven different countries participated was extremely stimulating The discussions were very lively and sometimes reflected the divergence of opinion which may persist on some topics

New Zealand Medical Journal, 1995

Long-Term Management of Patients After Myocardial Infarction C. Tissa Kappagoda, P.V. Greenwood, 2012-12-06 The management of patients who present with a myocardial infarction has altered radically over the past two decades The expansion of knowledge relating to the epidemiology of the condition together with a greater understanding of the causes of the early mortality from it have

resulted in major changes in the way these patients are treated during the acute phase of the illness. The development of dedicated Coronary Care Units in hospitals and the recognition of the need for Mobile Coronary Care Units in the community have made a major impact upon the early mortality from myocardial infarction. Over the past decade a great deal of attention has been paid to strategies designed to limit the size of a myocardial infarct. As an extension of this approach the 1980s have seen the evolution of techniques for revascularization of ischemic tissue. All these procedures while appearing to hold the promise of reducing the acute mortality from myocardial infarction create the need for a planned approach to the long term management of these patients. While there are some modest indications that coronary atherosclerosis could be arrested or even reversed for all practical purposes it remains a chronic progressive disease.

Cumulated Abridged Index Medicus, 1979 *Journal of Molecular and Cellular Cardiology*, 1982 **Irish Medical Journal**, 1982 Adaptation, Stress, and Prophylaxis Feliks Zalmanovich Meerson, 1984 **Hammersmith Cardiology Workshop Series**, 1987 *Progress in Pharmacology*, 1980 **Evidence-based Management of the Acute Coronary Syndrome** Roque Pifarré, Patrick J. Scanlon, 2001. Acute coronary syndrome ACS is at present the most common clinical entity requiring admission of a patient to an inpatient cardiology service. In the past evaluation and treatment options for patients with this syndrome were either empirical or based on observational reports of clinical outcomes. It is now generally agreed that to acquire meaningful clinical data a randomized clinical trial is the best method of clinical research. Over the past few years an ever increasing number of randomized clinical tests have resulted in a much deeper evidence based understanding of the pathophysiology, presentation, risk assessment and management of the acute coronary syndrome and its subsets i.e. unstable angina, non Q wave myocardial infarction and ST elevation Q wave infarction. This book organizes the data gleaned from these trials to allow the reader to better understand the best use of individual forms of evaluation and treatment and how these individual treatments can be best combined to result in optimal patient outcome.
