Biological Regulation And Development Vol 2:

Neuronal Development Nicholas C. Spitzer, 2013-03-09 Studies of simple and emerging systems have been undertaken to understand the processes by which a developing system unfolds and to understand more completely the basis of the complexity of the fully formed structures. The nervous system has long been particularly intriguing for such studies because of the early recognition of a multitude of distinctly differentiated states exhibited by nerve cells with different morphologies. Anatomical studies suggest that one liver cell may be very like another but indicate that neurons come in a remarkable diversity of forms. This diversity at the anatomical level has parallels at the physiological and biochemical levels. It is becoming increasingly easy to characterize the different cellular phenotypes of neurons. The repeatability with which these phenotypes are expressed may account in part for the specificity and reliability with which neurons form connections and it has allowed precise description of the first appearance and further development of the differentiated characteristics of individual neurons from relatively undifferentiated precursor cells. This represents a major advance over our knowledge of development at the level of tissues and makes it feasible to define and address questions about the underlying molecular mechanisms involved. Central to these advances has been the clear recognition that there is no single best preparation for the study of neuronal development. Furthermore, it has become evident that no single technique can tell us all we want to know.

Development Vincenzo E.A. Russo, Stuart Brody, David Cove, Sergio Ottolenghi, 2012-12-06 As a result of the molecular genetic analysis of development, similar mechanisms for the regulation of gene expression are found in a wide range of organisms. In *Development: The Molecular Genetic Approach*, these common mechanisms as well as the specific events leading to a differentiated cell are described. Particular items treated are, for example, how asymmetry is achieved, how cell size is determined, how cell division is controlled, how cell lineage influences development, how cells know their position, and how cells communicate during development.

The Epigenetic Nature of Early Chordate Development Pieter D. Nieuwkoop, A. G. Johnen, B. Albers, 1985-08-15 This volume summarises our present knowledge of inductive interaction during early development of various groups of chordates. Embryonic development is mainly epigenetic, that is, each embryo arises through gradual organisation and emergence of its constituent parts and not by the unfolding of preformed structures. Development as far as the full development of the body plan in the embryo is described. At the beginning of development there is only very restricted spatial diversity, but as development proceeds, the interaction of the different parts leads to ever increasing spatial complexity of the developing embryo. Interaction starts between the different cell organelles of the oocyte and the spermatozoon; it continues without interruption between the different parts of the very early embryo and also between the different tissues and organ anlagen of the developing embryo. The new hypothesis as to the nature of the inductive interaction, which is postulated here, is in good agreement with the experimental evidence presented and opens new possibilities for fruitful research into this basic concept of embryonic development.

Bio-based Solutions for

Sustainable Development of Agriculture, Volume II Eduardo V. Soares, Helena M. V. M. Soares, Spyridon Alexandros Petropoulos, 2024-11-26 The agricultural industry is primarily driven by the fast growth of the population and the subsequent need to supply sufficient food globally. It is estimated that the global population will expand from 8 billion to about 9 billion in 2050 and crop production needs to double in order to supply enough food for all people by 2050. Moreover, the climate change and the intensification of areas of infertile and unproductive soil create new and additional difficulties. It is urgent and of utter importance to find alternative practices to the traditional ones based on the indiscriminate use of various synthetic chemicals e.g. fertilizers and pesticides which are mainly used nowadays to overcome current and future agricultural challenges in a natural, more efficient and sustainable way. Recent regulations EU 1009/2019 and Farm Bill in EU and USA respectively promote the adoption of biostimulants in agriculture and open the market for new and innovative solutions. This regulation is a major step forward that should encourage the scientific community in strict interaction with the industry in the continuous development of new bio-based solutions for modern agriculture. Hormone Action Robert F. Goldberger, Keith R. Yamamoto, 2013-11-21 The motivation for us to conceive this series of volumes on regulation was mainly our belief that it would be fun and at the same time productive to approach the subject in a way that differs from that of other treatises. We thought it might be interesting and instructive for both author and reader to examine a particular area of investigation in a framework of many different problems. Cutting across the traditional boundaries that have separated the subjects in past volumes on regulation is not an easy thing to do not because it is difficult to think of what interesting topics should replace the old ones but because it is difficult to find authors who are willing to write about areas outside those pursued in their own laboratories. Anyone who takes on the task of reviewing a broad area of interest must weave together its various parts by picking up the threads from many different laboratories and attempt to produce a fabric with a meaningful design. Finding persons who are likely to succeed in such a task was the most difficult part of our job. In the first volume of this treatise most of the chapters dealt with the mechanisms of regulation of gene expression in microorganisms. The second volume involved a somewhat broader area spanning the prokaryotic-eukaryotic border. Topics ranged from phage morphogenesis to the role of gradients in development. This third volume, Volume 3A, concerns hormones as does the forthcoming companion volume, Volume 3B. Subject Guide to Books in Print, 2001 Nuclear Structures A. J. MacGillivray, G. D.
