

# 1. Principle of Least Square

- The least-square method states that the curve that best fits a given set of observations, is said to be a curve having a minimum sum of the squared residuals (or deviations or errors) from the given data points.
- Let us assume that the given points of data are  $(x_1, y_1)$ ,  $(x_2, y_2)$ ,  $(x_3, y_3)$ , ...,  $(x_n, y_n)$  in which all  $x$ 's are independent variables, while all  $y$ 's are dependent ones. Also, suppose that  $f(x)$  be the fitting curve and  $d$  represents error or deviation from each given point.
