Mathematical Models for Remote Sensing Image Processing Gabriele Moser, Josiane Zerubia, 2017-11-28 This book maximizes reader insights into the field of mathematical models and methods for the processing of two dimensional remote sensing images It presents a broad analysis of the field encompassing passive and active sensors hyperspectral images

synthetic aperture radar SAR interferometric SAR and polarimetric SAR data At the same time it addresses highly topical subjects involving remote sensing data types e g very high resolution images multiangular or multiresolution data and satellite image time series and analysis methodologies e g probabilistic graphical models hierarchical image representations kernel machines data fusion and compressive sensing that currently have primary importance in the field of mathematical modelling for remote sensing and image processing Each chapter focuses on a particular type of remote sensing data and or on a specific methodological area presenting both a thorough analysis of the previous literature and a methodological and experimental discussion of at least two advanced mathematical methods for information extraction from remote sensing data This organization ensures that both tutorial information and advanced subjects are covered With each chapter being written by research scientists from at least two different institutions it offers multiple professional experiences and perspectives on each subject The book also provides expert analysis and commentary from leading remote sensing and image processing researchers many of whom serve on the editorial boards of prestigious international journals in these fields and are actively involved in international scientific societies Providing the reader with a comprehensive picture of the overall advances and the current cutting edge developments in the field of mathematical models for remote sensing image analysis this book is ideal as both a reference resource and a textbook for graduate and doctoral students as well as for remote sensing scientists and practitioners

Collected Works (volume 1): Published Papers Stephen Luttrell, 2023-10-24 The motivation for the research that is described in these volumes is the wish to explain things in terms of their underlying causes rather than merely being satisfied with phenomenological descriptions When this reductionist approach is applied to information processing it allows the internal structure of information to be analysed so information processing algorithms can then be derived from first principles One of the simplest examples of this approach is the diagonalisation of a data covariance matrix there are many variants of this basic approach such as singular value decomposition in which the assumed independent components of high dimensional data are identified and extracted The main limitation of this type of information analysis approach is that it is based on linear algebra applied globally to the data space so it is unable to preserve information about any local data structure in the data space For instance if the data lives on a low dimensional curved manifold embedded in the data space then only the global properties of this manifold would be preserved by global linear algebra methods In practice data whose high dimensional structure is non trivial typically lives on a noisy version of a curved manifold so techniques for analysing such data must automatically handle this type of structure For instance a blurred image of a point source is described by its underlying degrees of freedom i e the position of the source and as the source moves about it generates a curved manifold that lives in the high dimensional space of pixel values of the sampled image The basic problem is then to deduce the internal properties of this manifold by analysing examples of such images A more challenging problem would be to extend this analysis to images that contain several overlapping blurred images of point sources and so on There

is no limit to the complexity of the types of high dimensional data that one might want to analyse These methods then need to be automated so that they do not rely on human intervention which would then allow them to be inserted as components into information processing networks The purpose of the research that is described in these volumes is to develop principled information processing methods that can be used for such analysis Self organising information processing networks arise naturally in this context in which ways of cutting up the original manifold into simpler pieces emerge automatically
