Applications of Evolutionary Computation in Chemistry

Roy L. Johnston¹, Hugh M. Cartwright²

Abstract: The field of Evolutionary Computation covers a wide range of computational approaches, including: Evolutionary Algorithms -of which Genetic Algorithms are probably the most widely studied; Evolutionary Strategies; and Evolutionary or Genetic Programming. What these approaches have in common is that they are based (more or less closely) on principles of biological evolution -using operators that are analogues of natural processes (such as genetic crossover, mutation and natural selection) to explore multi-dimen... Evolutionary Algorithms in Molecular Design David E. Clark,2008-11-21 When trying to find new methods and problem solving strategies for their research scientists often turn to nature for inspiration An excellent example of this is the application of Darwin s Theory of Evolution particularly the notion of the survival of the fittest in computer programs designed to search for optimal solutions to many kinds of problems These evolutionary algorithms start from a population of possible solutions to a given problem and by applying evolutionary principles evolve successive generations with improved characteristics until an optimal or near optimal solution is obtained This book highlights the versatility of evolutionary algorithms in areas of relevance to molecular design with a particular focus on drug design The authors all of whom are experts in their field discuss the application of these computational methods to a wide range of research problems including conformational analysis chemometrics and quantitative structure activity relationships de novo molecular design chemical structure handling combinatorial library design and the study of protein folding In addition the use of evolutionary algorithms in the determination of structures by X ray crystallography and NMR spectroscopy is also covered These state of the art reviews together with a discussion of new techniques and future developments in the field make this book a truly valuable and highly up to date resource for anyone engaged in the application or development of computer assisted methods in scientific research **Evolutionary Computation in Data Mining** Ashish Ghosh,2006-06-22 Data mining DM consists of extracting interesting knowledge from re world large and is the core step of a broader process called the knowledge discovery from databases KDD process In addition to the DM step which actually extracts knowledge from data the KDD process includes several preprocessing or data preparation and post processing or knowledge refinement steps The goal of data preprocessing methods is to transform the data to facilitate the application of a or several given DM algorithm s whereas the goal of knowledge refinement methods is to validate and refine discovered knowledge Ideally discovered knowledge should be not only accurate but also comprehensible and interesting to the user The total process is highly computation intensive The idea of automatically discovering knowledge from databases is a very attractive and challenging task both for academia and for industry Hence there has been a growing interest in data mining in several AI related areas including evolutionary algorithms EAs The main motivation for applying EAs to KDD tasks is that they are robust and adaptive search methods which perform a global search in the space of candidate solutions for instance rules or another form
