SUBJECT DESCRIPTION

People often think of Mathematics as a collection of different axioms and theorems, which build a complete theoretical system but have few connections (or no connections at all) with real life problems. Fortunately, this conception of Mathematics, or at least of what we could call "applied mathematics in social sciences," has changed over the last decades. From this new point of view, one must think of Mathematics, not as a subject but as a collection of tools that are needed in any rigorous and complete analysis of complex problems in different contexts such as the economy, business, society, or public policies.

We are living the birth of the fourth industrial revolution in light of some extraordinary technological advances. Simultaneous to this significant upheaval are an arrangement of financial, geopolitical, and demographic drivers of progress, each interacting in multiple directions and intensifying one another. This challenging scenario opens new opportunities for those professionals capable of managing and analyzing such complex situations.

A recently published report from the World Economic Forum states that to be able to solve complex problems is going to be the most valuable skill for coming years. A lack of proficiency in mathematics is the primary limitation to improving the power of abstraction which is a crucial requirement for complex problem-solving. Students following this course will learn useful tools to analyze economic, and management problems.
