Atmospheric Carbon Dioxide and the Global Carbon Cycle John R. Trabalka,1986      **The Carbon Cycle and Atmospheric CO2** Eric T. Sundquist,Wallace S. Broecker,1985      The Changing Carbon Cycle John R. Trabalka,David E. Reichle,2013-03-09 The United States Government cognizant of its responsibilities to future generations has been sponsoring research for nine years into the causes effects and potential impacts of increased concentrations of carbon dioxide CO in the atmosphere Agencies such as the National Science Foundation National Oceanic and Atmospheric Administration and the U S Department of Energy DOE cooperatively spent about 100 million from FY 1978 through FY 1984 directly on the study of CO The DOE as the 2 lead government agency for coordinating the government s research efforts has been responsible for about 60% of these research efforts William James succinctly defined our purpose when he stated science must be based upon irreducible and stubborn facts Scientific knowledge can and will reduce the present significant uncertainty surrounding our understanding of the causes effects and potential impacts of increasing atmospheric CO2 We have come far during the past seven years in resolving some underlying doubts and in narrowing the ranges of disagreement Basic concepts have become less murky Yet much more must be accomplished more irreducible and stubborn facts are needed to reduce the uncertainties so that we can improve our knowledge base Uncertainty can never be reduced to zero However with a much improved knowledge base we will be able to learn understand and be in a position to make decisions

Atmospheric Carbon Dioxide and the Global Carbon Cycle ,1987 The biogeochemical cycling of carbon between its sources and sinks determines the rate of increase in atmospheric CO2 concentrations The observed increase in atmospheric CO2 content is less than the estimated release from fossil fuel consumption and deforestation This discrepancy can be explained by interactions between the atmosphere and other global carbon reservoirs such as the oceans and the terrestrial biosphere including soils Undoubtedly the oceans have been the most important sinks for CO2 produced by man But the physical chemical and biological processes of oceans are complex and therefore credible estimates of CO2 uptake can probably only come from mathematical models Unfortunately one and two dimensional ocean models do not allow for enough CO2 uptake to accurately account for known releases Thus they produce higher concentrations of atmospheric CO2 than was historically the case More complex three dimensional models while currently being developed may make better use of existing tracer data than do one and two dimensional models and will also incorporate climate feedback effects to provide a more realistic view of ocean dynamics and CO2 fluxes The instability of current models to estimate accurately oceanic uptake of CO2 creates one of the key uncertainties in predictions of atmospheric CO2 increases and climate responses over the next 100 to 200 years 60 refs 1 fig 2 tabs      **The Phanerozoic Carbon Cycle** Robert A. Berner,2004-08-19 Examines the processes that lead to the long term carbon cycle and concludes with a chapter apiece on the evolution of atmospheric carbon dioxide and oxygen concentrations      The Global Carbon Cycle Martin Heimann,2013-06-29 This book is the

outcome of a NAill Advanced Study Institute on the contemporary global carbon cycle held in n Ciocco Italy September 8 20 1991 The motivation for this ASI originated from recent controversial findings regarding the relative roles of the ocean and the land biota in the current global balance of atmospheric carbon dioxide Consequently the purpose of this institute was to review among leading experts in the field the multitude of known constraints on the present day global carbon cycle as identified by the fields of meteorology physical and biological oceanography geology and terrestrial biosphere sciences At the same time the form of an Advanced Study Institute was chosen thus providing the opportunity to convey the information in tutorial form across disciplines and to young researchers entering the field The first three sections of this book contain the lectures held in II Ciocco The first section reviews the atmospheric large scale global constraints on the present day carbon cycle including the emissions of carbon dioxide from fossil fuel use and it provides a brief look into the past The second section discusses the role of the terrestrial biosphere and the third the role of the ocean in the contemporary global carbon cycle

**The Ocean Carbon Cycle and Climate** Mick Follows, Temel Oguz, 2004-08-03 Our desire to understand the global carbon cycle and its link to the climate system represents a huge challenge These overarching questions have driven a great deal of scientific endeavour in recent years What are the basic oceanic mechanisms which control the oceanic carbon reservoirs and the partitioning of carbon between ocean and atmosphere How do these mechanisms depend on the state of the climate system and how does the carbon cycle feed back on climate What is the current rate at which fossil fuel carbon dioxide is absorbed by the oceans and how might this change in the future To begin to answer these questions we must first understand the distribution of carbon in the ocean its partitioning between different ocean reservoirs the solubility and biological pumps of carbon the mechanisms controlling these reservoirs and the relationship of the significant physical and biological processes

to the physical environment The recent surveys from the JGOFS and WOCE Joint Global Ocean Flux Study and World Ocean Circulation Experiment programs have given us a first truly global survey of the physical and biogeochemical properties of the ocean These new high quality data provide the opportunity to better quantify the present oceans reservoirs of carbon and the changes due to fossil fuel burning In addition diverse process studies and time series observations have clearly revealed the complexity of interactions between nutrient cycles ecosystems the carbon cycle and the physical environment

**Atmospheric Carbon Dioxide and the Global Carbon Cycle** John R. Trabalka,1985      **Atmospheric Carbon Dioxide and the Global Carbon Cycle** John R. Trabalka,1985      **The Carbon Cycle** T. M. L. Wigley,D. S. Schimel,2000-05-08 Reducing carbon dioxide CO2 emissions is imperative to stabilizing our future climate Our ability to reduce these emissions combined with an understanding of how much fossil fuel derived CO2 the oceans and plants can absorb is central to mitigating climate change In *The Carbon Cycle* leading scientists examine how atmospheric carbon dioxide concentrations have changed in the past and how this may affect the concentrations in the future They look at the carbon budget and the missing sink for carbon dioxide They offer approaches to modeling the carbon cycle providing mathematical tools for predicting future levels of carbon dioxide This comprehensive text incorporates findings from the recent IPCC reports New insights and a convergence of ideas and views across several disciplines make this book an important contribution to the global change literature      *Changes in the Global Carbon Cycle and the Biosphere* Jerry S. Olson,Helen A. Pfuderer,Yip-Hoi Chan,1978      Carbon in the Geobiosphere Fred T. Mackenzie,Abraham Lerman,2006-12-29 The book covers the fundamentals of the biogeochemical behavior of carbon near the Earth s surface It is mainly a reference text for Earth and environmental scientists It presents an overview of the origins and behavior of the carbon cycle and atmospheric carbon dioxide and the human effects on them The book can also be used for a one semester course at an intermediate to advanced level addressing the behavior of the carbon and related cycles      **The Carbon Cycle and Atmospheric CO'2'** Eric T. Sundquist,1987      Global Carbon Cycle and Climate Change Kirill I[A]kovlevich Kondrat'ev,Vladimir F. Krapivin,Costas Varotsos,2003-09-24 Professor Kondratyev and his team consider the concept of global warming due to the greenhouse effect and put forward a new approach to the problem of assessing the impact of anthropogenic processes Considering data on both sources and sinks for atmospheric carbon and various conceptual schemes of the global carbon dioxide cycle they suggest a new approach to studies of the problem of the greenhouse effect They assess the role of different types of soil and vegetation in the assimilation of carbon dioxide from the atmosphere and discuss models of the atmosphere ocean gas exchange and its role in the carbon dioxide cycle paying special attention to the role of the Arctic Basin The authors also consider models of other global atmospheric cycles for a range of atmospheric constituents and conclude by drawing together a range of scenarios on modelling the global carbon cycle      A History of Atmospheric CO2 and Its Effects on Plants, Animals, and Ecosystems James R.
