*Carbon Fibers Filaments and Composites* J.L. Figueiredo, Carlos A. Bernardo, R.T.K. Baker, K.J. Hüttinger, 2013-03-14

Conventional synthetic materials like metals ceramics or glass are usually isotropic substances and their suitability for structural applications is achieved by morphological design and combination in the macroscopic scale. However, in modern engineering this is often not acceptable. As an alternative, the use of non-homogeneous anisotropic materials with significant stiffness and strength only in the directions these mechanical properties are really needed can lead to enormous material and weight savings. This is the case of multiphase systems called composite materials. In these composites, different material parts are added and arranged geometrically under clearly designed and controlled conditions. Usually, a structure of fibers provides strength and stiffness, and a matrix holds them together whilst providing the geometric form. Carbon fibers are among the high-performance fibers employed in these advanced structural composites, which are profoundly changing many of today's high-technology industries. New research and development challenges in this area include upgrading the manufacturing process of fibers and composites in order to improve characteristics and reduce costs and modifying the interfacial properties between fibers and matrix to guarantee better mechanical properties. The interdisciplinary nature of this new frontier is obvious, involving chemistry, materials science, chemical and mechanical engineering. Other topics which more often are treated separately are also important for the understanding of the processes of fiber production. Carbon filaments is one such topic as the study of their mechanisms of nucleation and growth is clearly quite relevant to the production of vapour-grown carbon fibers.

Most literature pertaining to carbon fibers is of a theoretical nature. *Carbon Fibers and their Composites* offers a comprehensive look at the specific manufacturing of carbon fibers and graphite fibers into the growing surge of diverse applications that include flameproof materials, protective coatings, biomedical and prosthetics application.

[Carbon Fiber Composites](#) Deborah Chung, 2012-12-02. In *Carbon Fiber Composites* the reader is introduced to a wide range of carbon fiber composites including polymer matrix, metal matrix, carbon matrix, ceramic matrix and hybrid composites. The subject is examined in a tutorial fashion so that no prior knowledge of the field is required. In contrast to other books on composites, this book emphasizes materials rather than mechanics as the prominence of composite materials has resulted from their increased presence in applications other than structure. Provides up-to-date information on the entire spectrum of carbon fiber composites. Emphasizes processing as the foundation of composite materials development. Addresses the processing properties and applications of each type of material systematically.

[Carbon Reinforcements and Carbon/Carbon Composites](#) Erich Fitzer, Lalit M. Manocha, 1998. Carbon has been used as the most successful reinforcement for materials like glass, ceramics, metals and polymers. Carbon-carbon composites are used when extreme temperature conditions prevail. The authors give a comprehensive overview of the present status in this field as well as projections for new high-tech materials.
