D'Angelo,2017-08-02 *Linear and Complex Analysis for Applications* aims to unify various parts of mathematical analysis in an engaging manner and to provide a diverse and unusual collection of applications both to other fields of mathematics and to physics and engineering The book evolved from several of the author s teaching experiences his research in complex analysis in several

variables and many conversations with friends and colleagues It has three primary goals to develop enough linear analysis and complex variable theory to prepare students in engineering or applied mathematics for advanced work to unify many distinct and seemingly isolated topics to show mathematics as both interesting and useful especially via the juxtaposition of examples and theorems The book realizes these goals by beginning with reviews of Linear Algebra Complex Numbers and topics from Calculus III As the topics are being reviewed new material is inserted to help the student develop skill in both computation and theory The material on linear algebra includes infinite dimensional examples arising from elementary calculus and differential equations Line and surface integrals are computed both in the language of classical vector analysis and by using differential forms Connections among the topics and applications appear throughout the book The text weaves abstract mathematics routine computational problems and applications into a coherent whole whose unifying theme is linear systems It includes many unusual examples and contains more than 450 exercises

Carleman's Formulas in Complex Analysis L.A. Aizenberg,2012-12-06 Integral representations of holomorphic functions play an important part in the classical theory of functions of one complex variable and in multidimensional complex analysis in the later case alongside with integration over the whole boundary ∂D of a domain D we frequently encounter integration over the Shilov boundary $S D$ They solve the classical problem of recovering at the points of a domain D a holomorphic function that is sufficiently well behaved when approaching the boundary ∂D from its values on ∂D or on S Alongside with this classical problem it is possible and natural to consider the following one to recover the holomorphic function in D from its values on some set $M \subset \partial D$ not containing S Of course M is to be a set of uniqueness for the class of holomorphic functions under consideration for example for the functions continuous in D or belonging to the Hardy class H^p
