Crystal Chemistry:

Crystal Chemistry: From Basics To Tools For Materials Creation Gerard Ferey, 2016-12-02 This is a book for crystal chemistry lovers written by one of the pioneers of solid state chemistry MRS Bulletin Devoted to a diverse group of solid state scientists the book has two objectives both relating to structural chemistry i a progressive analytic familiarization with the main parameters that govern the organization of crystallized matter and related crystal structures ii a study of what are the various ways to read a structure far beyond its representation in scientific articles Hence the reader will from numerous examples illustrated in color analyze what are the main characteristics of these structures from their geometric characteristics their coordination polyhedra their connections with the resulting dimensionalities of these solids including also the defects they exhibit before looking at possibilities to classify structures within which recurrence laws can emerge Chemists are required to understand the potentials of a new structure for becoming future materials scientists The first part of the book is by no means a database for known structures but facilitates a progressive understanding of the organization of the solid state With these tools in hand the reader is invited in the later part of the book to analyze new structures and to also use new concepts for viewing structures in a more synthetic way for the future Such new vision is already leading to the creation of completely new solids with outstanding characteristics that find applications in societal problems concerning energy energy savings environment and health The content is not exclusively academic but relates to the creation of innovative materials through a more physical approach that might condition the future of materials *An introduction to crystal chemistry* R. Inorganic Reactions and Methods, The Formation of Bonds to Group-I, -II, and -IIIB Elements A. P. Hagen, 2009-09-17 Inorganic Reactions and Methods systemizes the discipline of modern inorganic chemistry according to a plan constructed by a council of editorial advisors and consultants that include three Nobel laureates E O Fischer H Taube and G Wilkinson Rather than producing a collection of unrelated review articles this series creates a framework that reflects the creative potential of this scientific discipline In a clear concise and highly organized manner it provides an in depth treatment of bond formation reactions categorized by element type The series covers all areas of inorganic chemistry including chemistry of the elements coordination compounds donor acceptor adducts organometallic polymer and solid state material and compounds relevant to bioinorganic chemistry A unique index system provides users with several fast options for accessing information on forming any bond type compound or reaction Coverage of both classical chemistry and the frontiers of today s research make this series a valuable reference for years to come
