## **Arterial Pollution:**

*Arterial Pollution* H. Peeters, 2013-03-09 This two week course on Arterial Pollution covered the field of atherosclerosis as a disease entity and includes its anatomical, physiopathological, epidemiologic, preventive and therapeutic aspects. With the cooperation of an outstanding group of international lecturers we have been able to present an overview of the disease and its accidents as it stands today. Such a scope differs greatly from the narrow workshops which only consider biochemical disorders e.g. the lipoproteins or the risk factors. We believe it was timely to study the entire physiopathological entity of arterial pollution and we included all aspects of the disease in one single sweep. We are grateful to the Nato Advanced Institute Programs for accepting this topic on the list of their sponsored initiatives and especially Mr di Lullo for his personal care. Whether we succeeded was proved by the audience to the Nato Advanced Study Institute at Maratea in September 1981 and will become clearer through the audience these proceedings will gain in the medical community. There is accumulating evidence that air pollution could induce elevated blood pressure and potentiate hypertension. Acute elevations in the outdoor air pollution levels can trigger immediate or shortly delayed increases in arterial blood pressure. Moreover, few studies suggest that short-term increases in the levels of particulate and gaseous pollutants could lead to an acute onset of hypertension. Prolonged exposure to outdoor air pollution is associated with elevated blood pressure. Furthermore, some longitudinal studies have linked long-term exposure to air pollution with the incidence of hypertension. Various components of air pollution such as inhalable particulate matter (PM<sub>2.5</sub>, PM<sub>10</sub>), nitrogen oxides, sulfur dioxide, and ozone have shown associations with blood pressure in some studies. The hypothesized underlying mechanisms include inflammatory reactions and oxidative stress in the lungs and in systemic circulation, imbalance of the autonomous nervous system, and pathologic changes in vascular endothelium. In addition to traditional susceptible groups such as elderly individuals or patients with chronic diseases, children and pregnant women could be especially susceptible to the adverse effects of air pollution. The interplay of air pollution with the related environmental exposures such as traffic noise and climate change should be investigated further. *Insights in Cardiovascular Epidemiology and Prevention: 2021* Lydia Bazzano, 2022-09-15.
