

acclimatization. Blair presents his observations on acclimatization to cold in animals. This is stimulating work, because he has reproduced frostbite using only low ambient temperatures. The lesions are closely comparable to those seen in man under field conditions. Sellers' studies confirm those of Blair in every particular, and his reproduction of partial acclimatization by thyroxin and cortisone is an important advance.

This book is recommended by three further features: Edholm's discussion of the hunting reaction (the finest since that of Sir Thomas Lewis in 1931), Fremont-Smith's knack of asking pointed questions and of summarizing problems, and the editing of Ferrer. Complete indexing and 185 selected references make it a significant, up-to-date, usable reference book on cold injury.

Absorption and Extraction. 2nd ed. Thomas K. Sherwood and Robert L. Pigford. New York-London: McGraw-Hill, 1952. 478 pp. \$7.50.

This book is a complete and welcome revision of the useful first edition published in 1937. In the intervening 15 years the text has grown from 278 small pages to 478 larger ones, and this increase in size well represents the amount of valuable information added in the new edition.

The authors have been successful in presenting a survey of the field of gas absorption, which relates the work on many diverse aspects of the problem to the main purpose of designing absorption equipment. Except in the case of the most important concepts, the exposition is not detailed. The general outline and the value of the subject matter are presented, and the student is left to work out the details of the subject, or he may consult the references given. In recent years, there has been a tendency in engineering texts to work out every possible problem and save the reader the necessity of looking up or thinking out anything for himself. The method employed in this book is, in this reviewer's opinion, much to be preferred.

The first chapter covers molecular diffusion and generally resembles that of the first edition. The second chapter is new; it deals with eddy diffusion and turbulent flow and is an important addition to the text. Chapter III is concerned mainly with the analogies among heat, momentum, and mass transfer; it contains references to much new data which help illustrate the usefulness of the methods discussed. There is a new chapter on simultaneous heat and mass transfer, and the chapter on the principles of design has been greatly improved and brought up to date. The authors allotted about the right amount of space to coefficients and to transfer units.

The section on the design for multicomponent systems has been changed to include more and better

various methods of estimating the pressure drop in towers, the flooding point, and the performance of various types of equipment under different conditions are the subjects of the chapters that follow. The chapter on simultaneous absorption and chemical reaction has been expanded to include much practical data not available in the first edition.

The final chapter on liquid extraction is not as complete as the rest of the book, but even here the authors' knack for summarizing the state of the field is well displayed. There is a short appendix concerned with the economic factors in absorption equipment design. This subject perhaps deserves a little more attention in a book of this kind.

Although the book has been reviewed from the point of view of a graduate text in chemical engineering, it should be added that it is a valuable reference work and should find a place in the library of most engineers.
