**Natural Resistance to and Host-Directed Prevention of Tuberculosis** Robert Wilkinson, Anna Kathleen Coussens, Thomas Richard Hawn, 2020-06-16 Tuberculosis remains an important bacterial disease responsible for more than one million deaths per year The risk of overt disease is highest in the first year post infection nevertheless asymptomatic chronic infection referred to as Latent Tuberculosis Infection LTBI may also be established LTBI cannot be ascertained directly it can only be inferred from a skin or blood test of immune sensitization Nevertheless it is often stated that one third of the world's population has LTBI The central tenet of Tuberculosis control has therefore been antibiotic treatment of overt disease and the selective less intensive antibiotic treatment of patients considered at risk of progression of LTBI Much Tuberculosis research has been directed towards elucidation of the mechanisms of host susceptibility to disease The best characterized immune risk factor for Tuberculosis is HIV 1 co infection Others include anti TNF therapies Diabetes Mellitus other forms of immunosuppression and cigarette smoking However in most clinical cases of Tuberculosis no underlying immunological defect can be identified Since the general assumption is that most people infected with *Mycobacterium tuberculosis* harbor immunity to Tuberculosis This encourages the hypothesis that vaccination should be possible and indeed Bacille Calmette Gu rin BCG vaccination confers protection against disseminated disease in children However BCG vaccination is not associated with reduced pulmonary disease in adults which is a significant limitation Furthermore it has been recognized that increased resistance to Tuberculosis occurs in specific populations These include i heavily exposed persons in whom tests of immune sensitization nevertheless remain persistently negative ii children aged between 5 years and puberty and iii persons with documented persistent positive tests of sensitization who nevertheless never manifest disease As progress towards the elimination of Tuberculosis is insufficient under current antibiotic based strategies the idea to enhance immune resistance either via improved vaccination or enhanced natural immunity is important Recent research interest has therefore increased attention on the analysis of resistance in humans The current BCG vaccine is conventionally thought to prevent progression of established infection

However vaccination strategies now also envisage the prevention of infection and relapse There has been a rapid growth of interest in adjunctive host directed immune interventions which aim to either enhance protective immunity or to regulate pathological tissue damaging immunity However the idea of host directed prevention is less widely discussed
