filigree double curved and long span glazed shells of minimal weight and ingenious details Innovative clear and  
understandable geometric principles for the design of double curved shell structures are explained in a practical manner The  
principles are simple to apply with the use of functions now available in most CAD programs The author demonstrates how  
floating and homogeneous structures can be created on these free forms particularly grid shells of planar rectangles These  
are especially suitable for glazing with flat panes and offer structural economical and architectural advantages Examples are  
provided to illustrate in simple ways the latest methods of form finding calculation and holistic optimisation through the  
complex interaction of structure form and topology Numerous examples built all over the world from 1989 to 2014 offer  
orientation and assistance in the design of such double curved shells Essential design parameters many details and node  
connections of constructed projects are presented and evaluated These structures have been built all over the world in close
