Advanced Distance Sampling S. T. Buckland, D. R. Anderson, K. P. Burnham, J. L. Laake, D. L. Borchers, L.

Thomas, 2004-08-19 This advanced text focuses on the uses of distance sampling to estimate the density and abundance of biological populations. It addresses new methodologies, new technologies, and recent developments in statistical theory and is the follow-up companion to *Introduction to Distance Sampling* OUP 2001. In this text, a general theoretical basis is established for methods of estimating animal abundance from sightings surveys, and a wide range of approaches to analysis of sightings data is explored. These approaches include modelling animal detectability as a function of covariates where the effects of habitat, observer, weather, etc. on detectability can be assessed; estimating animal density as a function of location, allowing for example, animal density to be related to habitat and other locational covariates; estimating change over time in populations, a necessary aspect of any monitoring programme; estimation when detection of animals on the line or at the point is uncertain, as often occurs for marine populations or when the survey region has dense cover; survey design and automated design algorithms allowing rapid generation of sound survey designs using geographic information systems; adaptive distance sampling methods which concentrate survey effort in areas of high animal density; passive distance sampling methods which extend the application of distance sampling to species that cannot be readily detected in sightings surveys but can be trapped; and testing of methods by simulation so that performance of the approach in varying circumstances can be assessed. Authored by a leading team, this text is aimed at professionals in government and environment agencies, statisticians, biologists, wildlife managers, conservation biologists, and ecologists, as well as graduate students studying the density and abundance of biological populations.

Introduction to Distance Sampling Stephen T. Buckland, 2001 This book introduces the suite of techniques known as distance sampling Of particular significance in this update is the chapter on study design and field methods which has been extensively re written and extended New technologies such as laser range finders theodolites and the Geographical Positioning System GPS are discussed and advice is given on a wide range of survey methods Analysis methods have been generalised throughout the use of various types of multiplier

Advanced Distance Sampling Stephen T. Buckland, 2023 Addressing new methodologies and technologies this text focuses on the use of distance sampling to estimate the density and abundance of biological populations

Distance Sampling S. T. Buckland, D. R. Anderson, K. P. Burnham, J. L. Laake, 1993-05-27 one can choose a point instead and measure the radial distances of the animals detected It is very appropriate that the leading exponents in this field have come together to produce an authoritative description on how to do it They bring with them many years of experience in this research area This book is a must for all those involved in estimating animal abundance as the methods can be used for such a wide variety of animal species including birds and marine mammals The methods also apply to clusters of animals such as schools of dolphins and to animal signs The beauty of such methods lies in the fact that not every animal has to be seen when a population is investigated At the heart of the methodology is a detectability function which is estimated in some robust fashion from the distances to the animals actually seen Many species are not always visible and may be detected by the sounds they make or by being flushed out into the open Clearly animals can have widely different behaviour patterns so that different models will be needed for different situations This book provides a tool box of such methods with a computer package which helps the researcher to select the right tool for each occasion The authors have a reputation for being very thorough and typically they endeavour to cover every conceivable situation that might be encountered in the field

Distance Sampling S.T. Buckland, D.R. Anderson, K.P. Burnham, J.L. Laake, 2013-05-14 Our environment and natural food resources are continually coming under threat so that the monitoring of population trends is essential today Whaling is a good example Here politics and conservation often clash and over the years more and more restrictions have been applied through the efforts of the International Whaling Commission in an endeavour to save some of our whale species from extinction Localized fisheries also need to be monitored and quotas set each year In some countries sports fishing and hunting are popular so that information is needed about the populations being exploited in order to determine such things as the duration of hunting season and bag limits Methods of estimating animal abundance have been developing steadily since the 1940s but over the last 20 years activity in this area has intensified and of this growth were two the subject has begun to blossom At the centre of the authors of this book David Anderson and Kenneth Burnham who have widely published in this field The need for computers in this area was soon recognized and David and Ken were joined by Jeffrey Laake who with his computing expertise helped to develop suitable software packages for

implementing some of the new techniques In the 1980s Stephen Buckland entered the arena and began to make his presence felt Among other contributions he firmly established the role of Monte Carlo and bootstrapping techniques in population estimation where the unique role of the computer could be fully exploited Best Practice Guidelines for the Surveys and Monitoring of Great Ape Populations ,2008 From the website The IUCN SSC Primate Specialist Group is publishing new guidelines for surveys and monitoring of great ape populations These guidelines address a need which has existed since great ape studies began the challenge of collecting consistently high quality data for comparison between a wide variety of sites and often across many years This need is driven less by academic interest than by the urgent demands of field based conservation The maelstrom of threats which now endanger all the great apes must be addressed by immediate action on every scale initiatives at individual sites strategies on the regional and national level and species wide action plans and international accords All of these efforts must be founded on accurate field data and to fully understand the impact of specific threats and to measure if conservation programs are succeeding it is essential to have baseline density estimates and sustained monitoring of great ape populations The newest publication in the Best Practice series outlines current approaches to these issues offering guidance and perspective on choices that must be made by wildlife biologists site managers government agencies and the conservation community at large This report provides an overview of the variety of survey methodologies that have been developed as well as a decision tree to help select the approach that is best for a particular site or situation depending on available resources As a continuation of this report a series of modules will be made available online which will present detailed information on survey design field techniques analytical approaches and practical issues such as logistics finance and standardized reporting These new IUCN guidelines will help researchers to standardize their data collection and just as importantly will allow for improved comparisons between datasets This will complement the A P E S database <http://apes.eva.mpg.de> which is intended to serve as a repository for survey data on great apes and to analyze trends in their populations These survey and monitoring guidelines combined with resources available via A P E S are important steps towards a comprehensive understanding of the conservation status of great apes at both the population and species level **The ACCOBAMS Survey Initiative (ASI): Implementing Large Scale Surveys for Marine Megafauna in the Mediterranean and Black Seas** Simone Panigada,Vincent Ridoux,Ayaka Amaha Ozturk,Nejla Bejaoui,Oliver Boisseau,2024-11-20 It is estimated that almost 10% of the worldwide marine biodiversity is encountered in the Mediterranean Sea which only represents 1% of oceans seas Whales dolphins and other marine megafauna seabirds turtles large fish play a key role in maintaining the equilibrium of marine ecosystems and are an essential component of the natural heritage of Mediterranean and Black Sea countries However these species face a variety of significant threats risk of collisions with maritime traffic bycatch in fishing gears habitat degradation acoustic disturbance chemical pollution and marine litter climate change The ACCOBAMS Survey Initiative ASI is a pilot program aimed at establishing an integrated and

coordinated monitoring system for cetaceans throughout the entire ACCOBAMS area Mediterranean and Black Seas Conducted in coordination with riparian countries it supports the implementation of European and regional policies in particular the Marine Strategy Framework Directive MSFD EU and the Ecosystem Approach process Barcelona Convention UNEP MAP In summer 2018 2019 a synoptic line transect sampling survey was carried out across the Black Sea Mediterranean Sea and contiguous Atlantic area combining visual methods aerial surveys and visual and passive acoustic monitoring PAM from vessels focused primarily on deep diving species and areas where aerial surveys were not possible

Introduction to Distance Sampling Stephen T. Buckland, David R Anderson, Kenneth Paul Burnham, Jeffrey Lee Laake, David Louis Borchers, Leonard Thomas, 2001 This book introduces the suite of techniques known as distance sampling so called because the common theme is the sampling of distances of objects from a line or point The objects are usually animals or groups of animals clusters and the primary aim is to estimate their density or abundance in a survey area In line transect sampling the sampled distances are the shortest or perpendicular distance from a detected object to the line It is the most widely used method for assessing the abundance of a wide range of terrestrial and marine animals In point transect sampling distances of detected objects from the sampled points are recorded This book provides a comprehensive introduction to both techniques and also describes several related techniques Introduction to Distance Sampling updates the 1993 book Distance Sampling which was the first and until now only book devoted to the topic The book is aimed at quantitative biologists and wildlife managers and statisticians involved in wildlife monitoring programmes Of particular significance in this update is the chapter on study design and field methods which has been extensively rewritten and extended New technologies such as laser range finders theodolites and the Geographical Positioning System GPS are discussed and advice is given on a wide range of survey methods Analysis methods have also been generalized through the use of various types of multiplier Many exercises have been introduced to make the book more useful to graduate students in

Wildlife Study Design Michael L. Morrison, William M. Block, M. Dale Strickland, Bret A. Collier, Markus J. Peterson, 2008-05-25 We developed the first edition of this book because we perceived a need for a compilation on study design with application to studies of the ecology conservation and management of wildlife We felt that the need for coverage of study design in one source was strong and although a few books and monographs existed on some of the topics that we covered no single work attempted to synthesize the many facets of wildlife study design We decided to develop this second edition because our original goal synthesis of study design remains strong and because we each gathered a substantial body of new material with which we could update and expand each chapter Several of us also used the first edition as the basis for workshops and graduate teaching which provided us with many valuable suggestions from readers on how to improve the text In particular Morrison received a detailed review from the graduate students in his Wildlife Study Design course at Texas A M University We also paid heed to the reviews of the first edition that appeared in the literature
