Advanced Planning and Scheduling in Manufacturing and Supply Chains Yuri Mauergauz,2016-04-25 This book is a guide to modern production planning methods

based on new scientific achievements and various practical planning rules of thumb. Several numerical examples illustrate most of the calculation methods while the text includes a set of programs for calculating production schedules and an example of a cloud based enterprise resource planning ERP system. Despite the relatively large number of books dedicated to this topic, *Advanced Planning and Scheduling* is the first book of its kind to feature such a wide range of information in a single work, a fact that inspired the author to write this book and publish an English translation. This work consists of two parts with the first part addressing the design of reference and mathematical models, bottleneck models and multi criteria models and presenting various sample models. It describes demand forecasting methods and also includes considerations for aggregating forecasts. Lastly, it provides reference information on methods for data stocking and sorting. The second part of the book analyzes various stock planning models and the rules of safety stock calculation while also considering the stock traffic dynamics in supply chains. Various batch computation methods are described in detail while production planning is considered on several levels including supply planning for customers, master planning and production scheduling. This book can be used as a reference and manual for current planning methods. It is aimed at production planning department managers, company information system specialists as well as scientists and PhD students conducting research in production planning. It will also be a valuable resource for students at universities of applied sciences.

Supply Chain Management Janat Shah, 2009

Supply Chain Planning Hans-Otto Günther, Herbert Meyr, 2009-03-05

In recent years, supply chain planning has emerged as one of the most challenging problems in the industry. As a consequence, the planning focus is shifting from the management of plant specific operations to a holistic view of the various logistics and production stages that is an approach in which suppliers, production plants and customers are considered as constituents of an integrated network. A major driving force behind this development lies in the globalization of the world economy which has facilitated the cooperation between different partners working together in world wide logistics networks. Hence, considerable cost savings can be gained from optimizing the structure and the operations of complex supply networks linking plants, suppliers, distribution centres and customers. Consequently, to improve the performance of the entire logistic chain, more sophisticated planning systems and more effective decision support are needed. Clearly, successful applications of supply chain management have driven the development of advanced planning systems (APS) which are concerned with supporting decision making activities at the strategic, tactical and operational decision level. These software packages basically rely on the application of quantitative methods which are used to model the underlying complex decision problems considering the limited availability of resources and the need to react on time to customer orders. The core module at the mid-term level of APS comprises operational supply chain planning. In many industries, production stages are assigned to different plants and distribution centres have been established at geographically dispersed locations.
