The Advanced Solid State Lasers (ASSL) conference continues to serve as a premier international forum for the dissemination of cutting-edge research in solid-state laser materials, architectures, and source technologies. The 2024 ASSL conference, held in Osaka, Japan, from October 20 to 24, 2024, upheld this tradition by highlighting significant advances in laser performance aimed at addressing the evolving needs of both scientific and industrial applications. As in past years, materials science remains a cornerstone of the conference, reflecting the central role that gain media—crystalline, ceramic, glass, or composite—play in defining the operational boundaries of laser sources. This year's contributions span a wide range of novel gain media, including ceramics, crystals, glasses, and 2D materials, along with enabling components such as saturable absorbers (SAs), nonlinear crystals, and microresonator structures. These developments support improved power scalability, spectral agility, and ultrashort pulse generation, while also introducing new functionalities in areas like structured light and dual-comb generation. The laser sources reported encompass diverse operational regimes, from continuous-wave (CW) operation to few-optical-cycle pulse generation, with spectral coverage ranging from the visible to the mid-infrared.

The 61 peer-reviewed articles selected for the ASSL-2024 Joint Feature Issue of *Optics Express* and JOSA B reflect the breadth and depth of innovation presented at the conference. Together, these contributions span laser materials, source architectures, nonlinear optics, and structured laser beams. We extend our sincere thanks to all contributing authors for sharing their most recent works, and to the reviewers for their critical insights, which ensured the high quality of this issue. We are also grateful to the editorial team at Optica Publishing Group—especially Carmelita Washington—for their dedicated support throughout the review and production process.

Laser gain materials and nonlinear crystals are at the core of solid-state laser technology. The focus is on the characterization of new materials and providing highly accurate material properties of both new and established crystals, glasses, and ceramics which are essential for optimizing and designing future laser sources. Laser gain media engineering continues to expand the operational limits of laser sources. Studies in this issue present detailed spectroscopic characterizations. Parameters such as absorption and emission cross-sections, thermal conductivity, and excited-state lifetimes are systematically examined to support future device optimization. This collection includes several noteworthy contributions that explore new host materials,
