This series which began publication in 1960 is the oldest continuously published anthology that chronicles the ever changing information technology field. In these volumes we publish from 5 to 7 chapters three times per year that cover the latest changes to the design development use and implications of computer technology on society today. Covers the full breadth of innovations in hardware software theory design and applications. Many of the in depth reviews have become standard references that continue to be of significant lasting value in this rapidly expanding field. Advances in Computers Marshall C. Yovits, 1983 Praise for the Series Mandatory for academic libraries supporting computer science departments CHOICE Since its first volume in 1960 *Advances in Computers* has presented detailed coverage of innovations in computer hardware software theory design and applications. It has also provided contributors with a medium in which they can explore their subjects in greater depth and breadth than journal articles usually allow. As a result many articles have become standard references that continue to be of significant lasting value in this rapidly expanding field. **Advances in Computers** Marvin Zelkowitz, 2008 This series covers new developments in computer technology. Most chapters present an overview of a current subfield within computers with many citations and often include new developments in the field by the authors of the individual chapters. Advances in Computers Marvin Zelkowitz, 2008 This is volume 72 of *Advances in Computers* a series that began back in 1960 and is the oldest continuing series chronicling the ever changing landscape of information technology. Each year three volumes are produced which present approximately 20 chapters that describe the latest technology in the use of computers today. In this volume 72 we present the current status in the development of a new generation of high performance computers. The computer today has become ubiquitous with millions of machines being sold and discarded annually. Powerful machines are produced for only a few hundred U S dollars and one of the problems faced by vendors of these machines is that due to the continuing adherence to Moore's law where the speed of such machines doubles about every 18 months we typically have

more than enough computer power for our needs for word processing surfing the web or playing video games However the same cannot be said for applications that require large powerful machines Applications such as weather and climate prediction fluid flow for designing new airplanes or automobiles or nuclear plasma flow require as much computer power as we can provide and even that is not enough Today s machines operate at the teraflop level trillions of floating point operations per second and this book describes research into the petaflop region 1 015 FLOPS The six chapters provide an overview of current activities that will provide for the introduction of these machines in the years 2011 through 2015

Advances in Computers ,2003 Since 1960 *Advances in Computers* has chronicled the constantly shifting theories and methods of Information Technology which greatly shapes our lives today This volume the 59th in the series presents two general themes The first 4 papers discuss tool use in developing software how groups work together to produce a product and why the very industries that need them often do NOT adopt such tools The fifth paper addresses a current hardware issue cache coherence As we build faster machines a way to increase performance is to have multiple CPUs working on solving the same problem This requires two or more CPUs to address the same memory at the same time The cache coherence problem is how to allow both machines to access the same memory without stepping on each others toes so that memory gets lost or corrupted In depth surveys and tutorials on new computer technology Well known authors and researchers in the field Broad overview of many important developments Extensive bibliographies with most chapters Four out of 5 chapters focus on software developemnt technology and should appeal to a software development organization or a university course on software development practices *Advances in Computer Architecture* Glenford J. Myers,1978 A completely updated edition of this overview of modern computer architecture Examines alternatives to classical low level von Neumann computer architecture discussing the problems of classical architecture and new solutions to these problems Illustrates new concepts through in depth case studies of the Intel APX 432 IBM s SWARD and other machines State of the art concepts covered include tagged storage capability based addressing process management protection domains and error detection **Advances in Computers** Marvin Zelkowitz,2011-05-17 This series since its first volume in 1960 and now the oldest series still being published covers new developments in computer technology Each volume contains 5 to 7 chapters and 3 volumes are produced annually Most chapters present an overview of a current subfield within computer science including many citations and often new developments in the field by the authors of the individual chapters Topics include hardware software web technology communications theoretic underpinnings of computing and novel applications of computers The book series is a valuable addition to university courses that emphasize the topics under discussion in that particular volume as well as belonging on the bookshelf of industrial practitioners who need to implement many of the technologies that are described In depth surveys and tutorials on new computer technology Well known authors and researchers in the field Extensive bibliographies with most chapters Many of the volumes are devoted to single themes or
