**Advances in X-Ray Analysis** W. Pickles, 2012-10-20 In the past the Denver X Ray Conference has served as a forum for the interchange of information between people working in the extremely varied applied technologies which are based on x ray physics This year we hoped to continue this tradition by emphasizing some of the technologies associated with the energy and process control industries which have expanded recently The development of nuclear fusion into a power source and the operation of the nuclear fission power reactor fuel cycle are two parts of the energy industry in which x ray technology is currently playing a major role The principle role of x ray technology in the effort to develop a controlled thermonuclear or fusion power reactor is that of a diagnostic tool to study the properties of high temperature plasmas Since this subject is relatively new to many it was reviewed in two of the invited papers The role of x ray technology in the nuclear fission reactor fuel cycle is primarily that of fluorescent x ray analysis of reactor fuel materials for the purposes of process control and nuclear safeguards during fabrication and reprocessing One of the invited papers reviewed this topic This year the subject of x ray lasers was also introduced via an invited paper If an x ray laser can be developed it will probably become the center of many new technologies The contributed papers this year covered x ray diagnostics of plasmas x ray lasers hardware and technique development for x ray fluorescence analysis atmospheric aerosol analysis and materials characterization

Progress in Medical Radiation Physics Colin G. Orton, 2013-11-11 The Progress in Medical Radiation Physics series presents in depth reviews of many of the significant developments resulting from the application of physics to medicine This series is intended to span the gap between research papers published in scientific journals which tend to lack details and complete textbooks or theses which are usually far more detailed than necessary to provide a working knowledge of the subject Each chapter in this series is designed to provide just enough information to enable readers to both fully understand the development described and apply the technique or concept if they so desire Thorough references are provided for those who wish to consider the original literature In this way it is hoped that the Progress in Medical Radiation Physics series will be a catalyst encouraging medical physicists to apply new techniques and developments in their daily practice

Traditionally the emphasis at each annual Denver X ray Conference is placed on a particular aspect of X ray analysis The past decade has seen a steady expansion of applications of portable X ray analyzers and probes in the field in boreholes and in plant process streams With this in mind the main theme of the current conference is field applications of X ray fluorescence with particular reference to analysis of raw materials such as rocks ores and coal The Plenary Session took up this theme with two invited papers reviewing applications of X ray emission techniques to geochemical borehole and on stream analysis and recent developments in portable instruments for alloy ore and other analyses The third paper took us further afield with a review of X ray spectrochemical analysis on Mars the Moon and Earth It is evident that portable X ray analyzers are finding more and more applications outside the conventional boundaries of X ray spectrometry Users are not analysts and sometimes not even scientists Until recently this trend has been hindered by the scientific nature of the instruments one needs to understand XRF methods in order to properly operate the instrument Microprocessor technology has made possible the development of precalibrated smart analyzers with readouts in quantities familiar to the user and interlocks to prevent erroneous operation Further developments along these lines were reported at this conference
