# Advances in Complex Control Systems Theory and Applications

Complex and large scale systems and networks have evolved in many fields: from communication data networks, banking, financial systems, bio-engineering and robotics to, amongst others, industrial control systems. In control engineering, the main driving force behind the expansion of large-scale complex systems has been the relatively low cost of installing advanced instrumentation hardware, the low cost of attaining high computing power and the desire to 'see' and 'monitor' as much of the process as possible.

Whereas previously a typical small scale manufacturing process would be controlled by a few dozen loops, this has now risen to thousands of loops complemented by extensive data logging facilities. Classical or even modern control systems design applications are reaching their practical limits in their abilities to analyse and study these complex systems. In particular, classical techniques generally lack the framework to handle large scale systems and/or lead to exceptionally poor performance, and modern methods have a tendency to completely disregard model complexity and general overtly complex control solutions.

At the same time, substantial increases in the cost of energy, raw material and labor has created an impetus for improved control of the systems. Numerous surveys have consistently shown that improved control will lead to more sustainable manufacturing, improved bottom line returns, efficiency gains and improved raw material yields.

Research in control of complex systems has received relatively little attention in recent years. This has been partly due to cheap cost of production and partly because study of model complexity evokes combinatorial optimisation problems which are extremely difficult to solve due to not having convenient mathematical features, such as, for example, convexity. Consequently, the overwhelming

majority of current industrial processes still run on a mixture of proportional integral (PI) and simple decentralised control systems implying that great amounts of resources remain un-utilised in these systems and networks. For example, in a typical industrial control system, the controllers might only be able to use as little as 5% of the information collected from the process for control purposes.

### Contributions

The call for papers for this special issue was warmly received by the control community. Fitting to the journal's title and scope, this selection of contributed papers by leading international researchers represents an excellent coverage of the field, including both theoretical and application papers. The set of 12 papers have been categorised into 4 areas as follows:

*Networked systems:* Many large complex systems nowadays are created by the networked connection of smaller subsystems. Control of networked systems is therefore a key topic in complex systems analysis and control. *Decentralised  $H_{\infty}$  quantisers design for uncertain interconnected networked systems* by Chen *et al.* deals with  $H_{\infty}$  controller design for uncertain interconnected systems using output feedback. In *Co-design of predictive controllers for wireless network control* by Irwin *et al.*, the network is assumed to be wireless and the authors propose predictive solutions to deal with the uncertain time delays. The final contribution in this category, *Network load minimisation design for dual-rate internet-based control systems* by Li *et al.*, deals with control of networked systems over the internet.

*Large scale systems:* Complex systems are synonymous with large scale systems. In this category, our first contribution is titled *Decentralised state feedback design for large-scale linear*

## **Advances In Control Systems Theory Volume 4:**

**Advances in Control Systems** C. T. Leondes, 2014-12-01 *Advances in Control Systems Theory and Applications Volume 4* provides information pertinent to the significant progress in the field of automatic control. This book presents several fundamental approaches to algorithms for the determination of optimum control inputs to a system. Organized into six chapters, this volume begins with an overview of presents the method of sequential optimization including examples of its application. This text then examines the powerful direct method of Liapunov function techniques to the subject of the stability of stochastic dynamical systems. Other chapters consider the aspect of optimum control of large scale complex system which is the most striking characteristic in the evolution of the practice of control systems theory. This book discusses as well the basic techniques for the modification of the control problem. The final chapter deals with the problem of convergence properties of the method of gradients. This book is a valuable resource for engineers. **Advanced Control Systems** Yuriy P. Kondratenko, Vsevolod M. Kuntsevich, Arkadii A. Chikrii, Vyacheslav F. Gubarev, 2022-09-01 *Advanced Control Systems Theory and Applications* provides an overview of advanced research lines in control systems as well as in design development and implementation methodologies for perspective control systems and their components in different areas of industrial and special applications. It consists of extended versions of the selected papers presented at the XXV International Conference on Automatic Control Automatics 2018 September 18-19, 2018 Lviv, Ukraine, which is the main Ukrainian Control Conference organized by Ukrainian Association on Automatic Control, National member organization of IFAC and Lviv National University Lvivska Politechnica. More than 100 papers were presented at the conference with topics including mathematical problems of control optimization and game theory, control and identification under uncertainty, automated control of technical, technological and biotechnical objects, controlling the aerospace craft, marine vessels and other moving objects, intelligent control and information processing, mechatronics and robotics, information measuring technologies in automation, automation and IT training of personnel, the Internet of things and the latest technologies. The book is divided into two main parts: the first concerning theory (7 chapters) and the second concerning applications (7 chapters) of advanced control systems. The first part, *Advances in Theoretical Research on Automatic Control*, consists of theoretical research results which deal with descriptor control, impulsive delay systems, motion control in condition of conflict, inverse dynamic models, invariant relations in optimal control, robust adaptive control, bio-inspired algorithms, optimization of fuzzy control systems and extremal routing problem with constraints and complicated cost functions. The second part, *Advances in Control Systems Applications*, is based on the chapters which consider different aspects of practical implementation of advanced control systems in particular special cases: in determining the spacecraft position and attitude using computer vision system, the spacecraft orientation by information from a system of stellar sensors, control synthesis of rotational and spatial spacecraft motion at approaching stage of docking, intelligent algorithms for the automation of complex biotechnical objects, an automatic control system for

the slow pyrolysis of organic substances with variable composition simulation complex of hierarchical systems based on the foresight and cognitive modelling and advanced identification of impulse processes in cognitive maps The chapters have been structured to provide an easy to follow introduction to the topics that are addressed including the most relevant references so that anyone interested in this field can get started in the area This book may be useful for researchers and students who are interesting in advanced control systems
