**Advances in Geophysics** Ru-Shan Wu,Valerie Maupin,2006-12-11 Significant progress in our understanding of the Earth s structure and functioning is dependent on new and original observations However these observations cannot be interpreted in a quantitative way without tools to model them and developing adequate modelling methods is also a prerequisite for progress Seismological raw data in the 21st century are mostly three component broadband recordings and require advanced numerical tools to be modelled especially if lateral variations in the model are accounted for in addition to the radial stratification of the Earth Considerable progress has been made concerning modelling of elastic waves in laterally heterogeneous structures in the last decades taking advantage of the development of computer power The number of articles related to new developments of diverse methods is enormous and it can be very difficult for newcomers to get an overview of the different methods available and to be able to find which method is most appropriate for his or her applications This book aims at giving introductions and basic reviews of the modelling methods for elastic waves in laterally heterogeneous structures which are most commonly used in contemporary seismology or may have great potential for the future

Seismic waves generated by earthquakes have been interpreted to provide us information about the Earth's structure across a variety of scales For short periods of less than 1 second the envelope of seismograms changes significantly with increased travel distance and coda waves are excited by scattering due to randomly distributed heterogeneities in the Earth Deterministic structures such as horizontally uniform velocity layer models in traditional seismology cannot explain these phenomena This book focuses on the Earth heterogeneity and scattering effects on seismic waves Topics covered are recent developments in wave theory and observation including coda wave analysis for mapping medium heterogeneity and monitoring temporal variation of physical properties radiation of short period seismic waves from an earthquake fault weak localization of seismic waves attenuation of seismic waves in randomly porous media synthesis of seismic wave envelopes in short periods and laboratory investigations of ultrasonic wave propagation in rock samples Understanding new methods for the analysis of short period seismic waves to characterize the random heterogeneity of the Earth on many scales Observations of seismic wave scattering Discussion of techniques for mapping medium heterogeneity and for monitoring temporal change in medium characteristics Up to date techniques for the synthesis of wave envelopes in random media Advances in geophysical research Institute of Geophysics.
