Physiology of Photoreceptor Organs Michelangelo G.F. Fuortes, 2012-12-06 This volume is a collection of essays which attempts to summarize the recent progress in the field of photoreceptor and retinal physiology Reflecting the way in which research is organized each author reports on the studies performed with the techniques with which he is most familiar

morphological chemical or physiological The first chapters describe the structure of visual cells and the histological architecture of the retina Next comes a summary of the laws governing photochemical reactions and a report on the biochemistry of photopigments Four articles cover the optical properties of invertebrate eyes and the electrophysiology and the interactions of their photoreceptors These are followed by a discussion of the properties of vertebrate eyes including chapters on optics on the electrical responses of rods and cones and on the functional organization of the retina The final chapter provides an extensive review of retinal biochemistry and metabolism Even though the experimental approach differs all studies are directed toward the solution of two basic problems transduction in the photoreceptors and organization often called information processing in the retina The central problem of photoreceptor cells is to determine how light produces a response We know that illumination evokes electrical changes and we have recently learned a great deal about the features of these changes The evidence indicates however that elaborate processes must be interposed between the absorption of photons by the pigment and the production of electric currents through the membrane These intermediary events remain to be unraveled

Annual Reports in Inorganic and General Syntheses-1974 Kurt Niedenzu, Hans Zimmer, 2013-10-22
Annual Reports in Inorganic and General Syntheses 1974 presents an organized annual summary of synthetic developments in inorganic chemistry and its related areas The book discusses the chemistry of simple and complex metal hydrides of main groups I II and III boron aluminium gallium indium thallium silicon germanium tin lead phosphorus arsenic antimony bismuth chalcogens halogens and pseudohalogens The text also describes the chemistry of scandium yttrium lanthanides actinides titanium zirconium hafnium vanadium niobium tantalum chromium molybdenum tungsten manganese technetium rhenium iron cobalt nickel ruthenium osmium rhodium and iridium The chemistry of palladium platinum copper silver gold zinc cadmium and mercury is also encompassed The book concludes by demonstrating the photochemical syntheses of inorganic compounds Chemists chemistry students and people working in chemical laboratories will find the book invaluable
