

THE POLYMERIZATION OF STYRENE

The polymerization of styrene is a well-studied reaction. It is a free-radical polymerization that proceeds through a series of steps: initiation, propagation, and termination. The rate of polymerization is dependent on the concentration of the monomer and the initiator, and the temperature of the reaction. The polymerization of styrene is exothermic, and the heat of polymerization is approximately -100 kJ/mol . The polymerization of styrene is used in the production of polystyrene, which is a common plastic material.
