Abstract: Cleft lip with or without cleft palate is one of the most common congenital malformations, with an average prevalence of 1 in 1000 live births. Cleft lip and/or palate is incredibly phenotypically diverse, with constant advancements and refinements in how we care for patients. This article presents an in-depth review of the latest advances and current evidence in cleft lip and palate surgery. This includes presurgical infant orthopedics, perioperative practice patterns including use of enhanced recovery after surgery (ERAS) protocols, patient-reported outcome measures, and the latest adjuncts in cheiloplasty and palatoplasty.

Keywords: cleft lip; cleft palate; presurgical infant orthopedics

1. Introduction

The history of cleft lip and palate surgery is rich with innovation and there is a constant push to provide optimal form and function for our patients. This has led to centuries of refinements that have challenged cleft surgeons to improve upon the work performed by those before them. The often-quoted Dr. Ralph Millard captured the essence of the field that still resonates today, “Semper investigans, nunquam perficiens. Always searching, never quite achieving perfection” [1].

The purpose of this article is to provide an in-depth evidence-based review of the latest advances in cleft lip and palate surgery, including presurgical infant orthopedics, patient-reported outcome measures, perioperative practice patterns including use of enhanced recovery after surgery (ERAS) protocols, and the latest adjuncts in cheiloplasty and palatoplasty.

2. Pre-Surgical Infant Orthopedics

In 2019, the American Cleft Palate-Craniofacial Association (ACPA) completed a survey of multidisciplinary cleft teams; half of the teams offered presurgical infant orthopedics (PSIO), with nasolabial molding (NAM) comprising 88.2% and the Latham appliance comprising 14.7% [2]. Lip taping, however, is by far the simplest, least labor-intensive, and most cost-effective method of presurgical infant orthopedics and is often used when patients are not candidates for other forms of PSIO. Recently, there have been increasing reports regarding the use and efficacy in cleft care [3–5]. Initial reports date back to 1905, by G. V. L. Brown [6], with a more contemporary study by Dr. Robert Pool in 1994 reporting on their experience of 22 patients (17 unilateral and 5 bilateral) over 16 years achieving a 53% reduction in the size of the gap of the alveolar segments (12.4 mm to 5.8 mm) prior to definitive cheiloplasty [7]. More recently, there have been two randomized clinical trials (RCTs) noting the efficacy of presurgical lip taping in unilateral cleft lip and palate on positively changing the maxillary arch dimensions [3] and nasolabial aesthetics [5]. Comparing two of the most commonly used PSIO in NAM, lip taping has achieved similar results with regard to reductions in alveolar gap and nasolabial symmetry in two prospective studies [8,9]. In a separate retrospective study, at Washington University in St. Louis, NAM was compared to a passive alveolar molding plate plus lip taping with similar outcomes [4]. Noteworthy was
