Advances In Convex Analysis And Global Optimization:

Advances in Convex Analysis and Global Optimization Nicolas Hadjisavvas, Panos M. Pardalos, 2013-12-01 There has been much recent progress in global optimization algorithms for nonconvex continuous and discrete problems from both a theoretical and a practical perspective Convex analysis plays a fundamental role in the analysis and development of global optimization algorithms This is due essentially to the fact that virtually all nonconvex optimization problems can be described using differences of convex functions and differences of convex sets A conference on Convex Analysis and Global Optimization was held during June 5-9 2000 at Pythagorion Samos Greece The conference was honoring the memory of C Caratheodory 1873-1950 and was endorsed by the Mathematical Programming Society MPS and by the Society for Industrial and Applied Mathematics SIAM Activity Group in Optimization The conference was sponsored by the European Union through the EPEAEK program the Department of Mathematics of the Aegean University and the Center for Applied Optimization of the University of Florida by the General Secretariat of Research and Technology of Greece by the Ministry of Education of Greece and several local Greek government agencies and companies This volume contains a selective collection of refereed papers based on invited and contributing talks presented at this conference The two themes of convexity and global optimization pervade this book The conference provided a forum for researchers working on different aspects of convexity and global optimization to present their recent discoveries and to interact with people working on complementary aspects of mathematical programming

Convex Analysis and Global Optimization Hoang Tuy, 2013-03-09 Due to the general complementary convex structure underlying most nonconvex optimization problems encountered in applications convex analysis plays an essential role in the development of global optimization methods This book develops a coherent and rigorous theory of deterministic global optimization from this point of view Part I constitutes an introduction to convex analysis with an emphasis on concepts properties and results particularly needed for global optimization including those pertaining to the complementary convex structure Part II presents the foundation and application of global search principles such as partitioning and cutting outer and inner approximation and decomposition to general global optimization problems and to problems with a low rank nonconvex structure as well as quadratic problems Much new material is offered aside from a rigorous mathematical development Audience The book is written as a text for graduate students in engineering mathematics operations research computer science and other disciplines dealing with optimization theory It is also addressed to all scientists in various fields who are interested in mathematical optimization

Abstract Convexity and Global Optimization Alexander M. Rubinov, 2013-03-14 Special tools are required for examining and solving optimization problems The main tools in the study of local optimization are classical calculus and its modern generalizations which form nonsmooth analysis The gradient and various kinds of generalized derivatives allow us to accomplish a local approximation of a given function in a neighbourhood of a given point This kind of approximation is very useful in the study of local extrema

However local approximation alone cannot help to solve many problems of global optimization so there is a clear need to develop special global tools for solving these problems The simplest and most well known area of global and simultaneously local optimization is convex programming The fundamental tool in the study of convex optimization problems is the subgradient which actually plays both a local and global role First a subgradient of a convex function f at a point x carries out a local approximation of f in a neighbourhood of x Second the subgradient permits the construction of an affine function which does not exceed f over the entire space and coincides with f at x This affine function h is called a support function Since $f(y) \geq h(y)$ for all y the second role is global In contrast to a local approximation the function h will be called a global affine support

Generalized Convexity, Generalized Monotonicity: Recent Results Jean-Pierre Crouzeix, Juan Enrique Martinez Legaz, Michel Volle, 2013-12-01 A function is convex if its epigraph is convex This geometrical structure has very strong implications in terms of continuity and differentiability Separation theorems lead to optimality conditions and duality for convex problems A function is quasiconvex if its lower level sets are convex Here again the geometrical structure of the level sets implies some continuity and differentiability properties for quasiconvex functions Optimality conditions and duality can be derived for optimization problems involving such functions as well Over a period of about fifty years quasiconvex and other generalized convex functions have been considered in a variety of fields including economics management science engineering probability and applied sciences in accordance with the need of particular applications During the last twenty five years an increase of research activities in this field has been witnessed More recently generalized monotonicity of maps has been studied It relates to generalized convexity of functions as monotonicity relates to convexity Generalized monotonicity plays a role in variational inequality problems complementarity problems and more generally in equilibrium problems
