Programmable Digital Signal Processors Yu Hen Hu,2001-12-06 Presents the latest developments in the programming and design of programmable digital signal processors PDSPs with very long instruction word VLIW architecture algorithm formulation and implementation and modern applications for multimedia processing communications and industrial control

Mit and the Birth of Digital Signal Processing Enders Robinson,2014-12-31 In the late 1950s the first transistorized digital computers were manufactured As a result the decade of the 1960s saw the conversion of the oil exploration industry from analog filtering to digital signal processing Digital signal processing and deconvolution made it possible to explore successfully in all areas of the Earth including the areas under the seas Deconvolution requires massive parallel processing The computer industry accommodated and developed special purpose digital signal processing DSP computers which at the time were called array processors also known as vector processors As time went on these DSP computers were replaced by microchips as were all digital computers In 1986 the National Academy of Engineering NAE of the United States of America elected Enders Robinson as member with the citation For pioneering contributions that have led to the evolution of seismic processing from hand digitization of the 1950s to today s custom deconvolution chip The hand digitization of the 1950s was the forerunner of what was to come Practically all communications today are done with digital data The telephone is digital the television is digital the cinema is digital the music is digital the camera is digital Now in the second decade of the twenty first century DSP chips are everywhere The deconvolution chip is the prototype digital signal processing DSP chip Usually the NAE credits new members for such things as innovative research or revolutionary discoveries Certainly such chips are vital but why would the NAE mention a chip and not mention seemingly more important mathematical research The National Academy foresaw what many others did not foresee In 1986 the Academy realized that the era of mathematical numeral analysis was losing its position at the forefront of computing Instead the era of communication was at the beginning of its meteoric rise to ascendancy Communication requires a massive use of digital signal processing Today in 2014 digital signal processing is a powerful technology used everywhere This technology is universally possible because of inexpensive and tiny DSP Digital Signal Processing chips DSP chips are an integral part of audio and video systems television telephones cameras radar sonar transmission fiber cable automobiles airplanes ships space vehicles programmable heart pacemakers other medical devices and all types of automation in manufacturing and logistics Digital Signal Processing DSP chips are used to satisfy the insatiable needs for communication among people and for the regulation and control of machines and devices DSP chips take real world signals like position voice audio video pressure temperature and medical readings to process them digitally in order to produce the desired results Every time you use a mobile phone you are using a DSP chip Every time you drive an automobile you are using several dozen DSP chips The new medical devices that monitor you health all use DSP

chips The birth of digital signal processing took place in the MIT Mathematics Department from 1950 to 1952 under the guidance of Prof Norbert Wiener The DSP chip uses the methods of digital signal processing that were run for the first time on the Whirlwind computer at MIT in 1952 This book takes you on a journey showing how this development evolved and led to the DSP chip This development took place because MIT President James R Killian challenged the conventional analog thinking of the time He stepped in and put up his presidential funds to support the DSP project that otherwise would have perished

Retargetable Code Generation for Digital Signal Processors Rainer Leupers, 1997-06-30 According to market analysts the market for consumer electronics will continue to grow at a rate higher than that of electronic systems in general The consumer market can be characterized by rapidly growing complexities of applications and a rather short market window As a result more and more complex designs have to be completed in shrinking time frames A key concept for coping with such stringent requirements is re use Since the re use of completely fixed large hardware blocks is limited to subproblems of system level applications for example MPEG 2 flexible programmable processors are being used as building blocks for more and more designs Processors provide a unique combination of features they provide flexibility and re use The processors used

in consumer electronics are however in many cases different from those that are used for screen and keyboard based equipment such as PCs For the consumer market in particular efficiency of the product plays a dominating role Hence processor architectures for these applications are usually highly optimized and tailored towards a certain application domain
