Digitale Systeme Zur Signalverarbeitung:

Digitale Systeme zur Signalverarbeitung Hans-Wilhelm Schüßler, 2013-03-09 Die Theorie kontinuierlicher Systeme die sowohl in der Analyse als auch in der Synthese von Netzwerken mit vorgeschriebenen Eigenschaften so außerordentlich wertvolle Ergebnisse brachte hat eine gewisse Konsolidierung erreicht Neben ihr hat sich in den letzten Jahren eine Theorie von diskreten Systemen entwickelt die wegen der digitalen Realisierungsmöglichkeiten schnell Interesse fand Ihre Ausarbeitung wurde sehr dadurch begünstigt da Fragestellungen und zum Teil auch Verfahren bei zweckmäßiger Abwandlung aus der Theorie kontinuierlicher Systeme übernommen werden konnten Das gilt vor allem für den Bereich in dem ein lineares Modellsystem den Betrachtungen zugrunde gelegt wird Es gilt im allgemeinen nicht mehr wenn die mit der digitalen Realisierung zusammenhängenden Probleme behandelt werden müssen Die für diskrete Systeme gewonnenen Ergebnisse finden sich in einer sehr schnell wachsenden Zahl von verstreuten Publikationen Mit dem vorliegenden Buch wird eine zusammenfassende Darstellung für die sogenannten eindimensionalen Systeme angestrebt Dabei wird das Ziel verfolgt neben der schon weit entwickelten Analyse auch den Entwurf solcher Systeme mit vorgeschriebenen Eigenschaften bis zum praktischen Aufbau zu behandeln Es wird zunächst ein durch lineare Differenzgleichungen beschriebenes Modellsystem eingeführt das dem realen System nur approximativ entspricht Nach einer Beschreibung der allgemeinen Eigenschaften wird das System im Zustandsraum behandelt Mit Hilfe der Z-Transformation wird die Übertragungsfunktion zu seiner Kennzeichnung eingeführt und damit eine Darstellung im Frequenzbereich gegeben Von den behandelten speziellen Systemen seien die mit streng linearer Phase besonders erwähnte Abschnitte über Frequenztransformationen und bemerkenswerte Strukturen schließen sich an

Digital Control Systems R. Isermann, 2013-03-09 The great advances made in large scale integration of semiconductors the resulting cost effective digital processors and data storage devices and the development of suitable programming techniques are all having increasing influence on the techniques of measurement and control and on automation in general The application of digital techniques to process automation started in about 1960 when the first process computer was installed From about 1970 computers have become standard equipment for the automation of industrial processes connected on line in open or closed loop The annual increase of installed process computers in the last decade was about 20-30% The cost of hardware has shown a tendency to decrease whereas the relative cost of user software has tended to increase Because of the relatively high total cost the first phase of digital computer application to process control is characterized by the centralization of many functions in a single though sometimes in several process computer Such centralization does not permit full utilization of the many advantages of digital signal processing and rapid economic pay off as analog backup systems or parallel standby computers must often be provided to cover possible breakdowns in the central computer In 1971 the first microprocessors were marketed which together with large scale integrated semiconductor memory units and input output modules can be assembled into more cost effective process microcomputers

Control Systems Rolf Isermann,2012-12-06 The great advances made in large scale integration of semiconductors and the resulting cost effective digital processors and data storage devices determine the present development of automation The application of digital techniques to process automation started in about 1960 when the first process computer was installed From about 1970 process computers with cathodic ray tube display have become standard equipment for larger automation systems Until about 1980 the annual increase of process computers was about 20 to 30% The cost of hardware has already then shown a tendency to decrease whereas the relative cost of user software has tended to increase Because of the high total cost the first phase of digital process automation is characterized by the centralization of many functions in a single though sometimes in several process computer Application was mainly restricted to medium and large processes Because of the far reaching consequences of a breakdown in the central computer parallel standby computers or parallel back up systems had to be provided This meant a substantial increase in cost The tendency to overload the capacity and software problems caused further difficulties In 1971 the first microprocessors were marketed which together with large scale integrated semiconductor memory units and input output modules can be assembled into cost effective microcomputers These microcomputers differ from process computers in fewer but higher integrated modules and in the adaptability of their hardware and software to specialized less comprehensive tasks
