National Research Council, Division on Earth and Life Studies, Polar Research Board, Committee on Principles of
Environmental Stewardship for the Exploration and Study of Subglacial Environments, 2007-08-09 Antarctica is renowned for
its extreme cold yet surprisingly radar measurements have revealed a vast network of lakes rivers and streams several
kilometers beneath the Antarctic ice sheet Sealed from Earth's atmosphere for millions of years they may provide vital
information about microbial evolution the past climate of the Antarctic and the formation of ice sheets among other things
The next stage of exploration requires direct sampling of these aquatic systems However if sampling is not done cautiously
the environmental integrity and scientific value of these environments could be compromised At the request of the National
Science Foundation this National Research Council assesses what is needed to responsibly explore subglacial lakes
Exploration of Antarctic Subglacial Aquatic Environments concludes that it is time for research on subglacial lakes to begin
and this research should be guided by internationally agreed upon protocols The book suggests an initial protocol which
includes full characterization of the lakes by remote sensing and minimum standards for biological and other types of
contamination *Immortal Verse* Edgar Simmons Buchanan, Philip Hanson Hiss, 1929
