Diesel Flowers Lance Clewett,1992 Handbook of Plant-Based Biofuels Ashok Pandey,2008-09-26 Explores Worldwide Trends Involving the Production and Use of Biofuels With the depletion of oil resources as well as the negative environmental impact of fossil fuels there is much interest in alternative energy sources Focusing on some of the most important alternate energy sources for the foreseeable future the Handbook of Plant **Analysis of Greenhouse Gas Emissions for Flower Producers in Ecuador** Maximilian Martin,2016-05 The goal of this study is the calculation of greenhouse gas emissions which occur during the production of Ecuadorian Flowers Emissions are considered beginning with the production of raw materials up to the point where the flowers are sold to the final wholesale This book describes the current status of international standardisation with their relevance to the calculation Currently there are no official regulations for CO2 calculations Because most of the flowers are sold to Europe the Life Cycle Assessment LCA regulations ISO 14040 ff have been applied for the methodology and the creation of the system model The importance of this standard has been pointed out as it will be the basis for upcoming European CO2 regulations Nowadays a widely accepted method is the greenhouse gas protocol which has been used partly for the calculations because only few sectors e g transportation are covered Further on the model of flower production is introduced The model includes all processes and the system boundaries Significant factors contributing to the greenhouse gas emissions are defined as airfreight of flower to the final market consumption of electricity and usage of fertilizers on the farm The process of collecting data is another subject of this study including the last audit data from the Flower Label Program FLP as well as independently created inquiries and visits on the pilot farms The calculation of CO2 emissions is comprised The sources of the emissions factors are described in the beginning which are mostly extracted from LCA software Furthermore this book proposes the next steps on the way to CO2 neutral flowers Firstly the calculation has to be certified by an independent organisation Subsequently a decision on CO2 compensation has to be taken The purchase of CO2 certificates from official or voluntary stock exchanges was recommended because self managed CO2 projects need start up time The last step is the marketing of the new product which should be realized with a CO2 label widely accepted in the distribution markets Parallel the farms should start to optimize their farms according to CO2 emissions Since global warming potential is only one measurement of interference with nature other criteria should be investigated as How is the quality of ground water To what extent occurs acidification in the cultivated areas An integrated LCA analysis would give answers to these questions *Current Abstracts* ,1995 **Engineering Index Annual** ,1930 **Information Bulletin** Soviet Union. carbon neutrality serves as a crucial guiding principle in addressing the global issue of climate change and fostering sustainable economic growth and ecological harmony Carbon emissions from land use account for 10% of the total global carbon emissions It is an important carbon source and sink of the earth system Therefore optimizing the land spatial pattern is one of the important means to promote carbon neutralization In 1997 Kyoto Protocol emphasized that countries could improve carbon sink capacity reduce carbon emissions and practice climate governance through afforestation forest management and farmland management In this context countries worldwide should actively optimize the land spatial pattern enhance the carbon sink capacity of terrestrial ecosystems and build a low carbon land use structure and land spatial pattern system There are mainly four types of territorial space conflicts The first is the conflict of development space which is a vicious expansion of urban space caused by excessive dependence on GDP The second is the conflict of land use space which is mainly reflected in the overlapping contradiction between cultivated land space and ecologically fragile space The third is the conflict caused by the disharmony of element space The fourth is the conflict of planning space characterized by the contradiction between ecological and construction spaces According to the IPCC report on the relationship between climate change and land the management mode of natural resources the transformation of space use and the improper allocation of factors will cause carbon sink profits and losses On the one hand land use carbon emissions may be the effect of land use control on the other hand it may also be caused by man made carbon emissions
