Detailed Course Agenda

First there will be a discussion about the basic network infrastructure, and how modern digital microwave radios fit into that. How was the situation up till today, and what is the perspective for the future in the fixed network and for the wireless mobile network.

Vector modulation is the modulation concept for all microwave radios today. A short summary will be given, and then the actual modulation formats used today will be discussed. This includes QPSK up to 256-QAM. The basics of the modulation and demodulation process will be explained.

Using examples on block diagram level a system will be described in its up and downlink. This starts at the preparation of the baseband signal, adding bits for error correction and signaling, RF processing including modulation, upconversion into RF, Antenna, Transmission with its problems and then reception, down processing into the baseband signal. In each step problems will be discussed.

Finally we will show certain system impairments like modulation quality problems. The system curve (waterfall curve) will be discussed and the correction mechanisms used for instance to correct for flat fading and frequency selective fading. Especially this last part will be strongly supported by experiments performed with a microwave radio and Keysight test equipment.
