Adomian, 1984-12-31 The purpose of this book is to present some new methods in the treatment of partial differential equations Some of these methods lead to effective numerical algorithms when combined with the digital computer Also presented is a useful chapter on Green's functions which generalizes after an introduction to new methods of obtaining Green's functions for partial differential operators Finally some very new material is presented on solving partial differential equations by Adomian's decomposition methodology This method can yield realistic computable solutions for linear or non linear cases even for strong nonlinearities and also for deterministic or stochastic cases again even if strong stochasticity is involved Some interesting examples are discussed here and are to be followed by a book dealing with frontier applications in physics and engineering In Chapter I it is shown that a use of positive operators can lead to monotone convergence for various classes of nonlinear partial differential equations In Chapter II the utility of conservation technique is shown These techniques are suggested by physical principles In Chapter III it is shown that dynamic programming applied to variational problems leads to interesting classes of nonlinear partial differential equations In Chapter IV this is investigated in greater detail In Chapter V we show that the use of a transformation suggested by dynamic programming leads to a new method of successive approximations **The Cumulative Book Index**, 1981 A world list of books in the English language Computational Modeling in Semiconductor Processing M.
