Current Topics In Cellular Regulation Volume 6:

Current Topics in Cellular Regulation Bernard L. Horecker, Earl R. Stadtman, 2014-06-28 Current Topics in Cellular Regulation Volume 21 examines the advances in the general area of cellular regulation This book discusses the roles of eukaryotic initiation factor 2 ancillary factors in the regulation of eukaryotic protein synthesis initiation and phosphorylation state of eIF 2 The monoclonal antibodies to cap binding proteins criteria for establishment of the biological significance of ribosomal protein phosphorylation and comparison with casein kinases from mammary gland are also elaborated This text likewise covers the regulation of phosphoprotein phosphatases poly ADP ribosyl ation reactions in vitro and induced commitment to terminal erythroid differentiation Other topics include the turnover characteristics of lactate dehydrogenase and role of urea synthesis in the removal of metabolic bicarbonate and regulation of blood pH This volume is useful to biologists and researchers interested in basic mechanisms involved in the regulation of diverse cellular activities Current Topics in Cellular Regulation Bernard L. Horecker, Earl R. Stadtman, 2014-06-28 Current Topics in Cellular Regulation Volume 6 presents the fundamental mechanisms involved in the regulation of diverse cellular activities including cellular differentiation intermediary metabolism and the transfer of genetic information This book provides information pertinent to the various aspects of cellular regulation Organized into eight chapters this volume begins with an overview of the well defined stages of sporulation that can be correlated with the appearance of several enzymes ultrastructures and chemical components associated with the developing spore This text then examines the regulatory properties of G6PD from various sources with emphasis to those cells in which these properties may operate in vivo in the control of carbohydrate metabolism Other chapters consider the various methods for analyzing biochemical systems The final chapter deals with kinetic cooperativity which is the basis of the flip flop mechanism This book is a valuable resource for biochemists biologists and research workers **Regulation of Carbohydrate Metabolism(1985)** Beitner, 2018-04-17 First Published in 1985 A collaboration of the latest research on regulation of carbohydrate metabolism **Principles of Metabolic Control in Mammalian Systems** Herman, 2013-11-11 In this work we present the basic principles of metabolic control which we hope will serve as a foundation for the vast array of factual matter which the biochemist and the physician engaged in metabolic research must accumulate Accordingly we attempt to set forth these principles along with sufficient explanation so that the reader may apply them to the ever expanding literature of biochemistry If we are successful this will provide a theoretical approach which can be applied to any given set of metabolic reactions It is impossible to enumerate each and every biochemical reaction and pathway since such a work would be too unwieldy for efficient use Rather we hope our presentation of the principles of metabolic control will be sufficiently basic to be of lasting usefulness no matter how detailed biochemistry may become We would like to be able to condense biochemistry into a theoretical biology that will not only allow for the general treatment of any given reaction but will enable predictions to be made as to the existence of necessary pathways

and the consequences of altered control. Such is not possible today but this may be accomplished in the future. We believe it is now possible to institute the beginnings of such a theoretical biology.

Biological Cycles Ronald W. Estabrook, Paul A. Srere, 2013-10-22. Current Topics in Cellular Regulation Volume 18. Biological Cycles covers topics on the events of molecular biology, cellular communication, and the merging of cell structure to biochemical function. The book discusses the ornithine-urea cycle, the cycles of glutathione metabolism and transport, and the role of multienzymatic proteins in mammalian pyrimidine biosynthesis. The text also describes the significance of interconvertible enzyme cycles in cellular regulation: regulation of mammalian pyruvate dehydrogenase complex by a phosphorylation-dephosphorylation cycle, replenishment of citric acid cycle intermediates by the purine nucleotide cycle in rat skeletal muscle, the control of a secondary pathway of ethanol metabolism by differences in redox state, the role of aldolase and fructose biphosphatase in the control of gluconeogenesis and glycolysis, and the fructose 6-phosphate/fructose 1,6-bisphosphate cycle. The book further tackles the cycles in polysaccharide biosynthesis and other important biological cycles. Biologists, microbiologists, cellular biologists, and biochemists will find the book invaluable.

Chemical Recognition in Biology F. Chapeville, A. L. Haenni, 2012-12-06. Studies of chemical recognition in biology were initiated about half a century ago with the first kinetic data obtained on enzyme catalysis and inhibition. They led to a rather static representation of the recognition process illustrated by the lock and key model that still continues to influence our overall image of recognition and its specificity. In several cases, crystallographic studies of enzyme-substrate complexes have supported this model. Indeed, in a crystallized ligand-enzyme complex, a close fit is observed between the active center of the enzyme and the functional groups of the ligand. However, this does not necessarily result from a direct recognition process between rigid structures but may result from a progressive adaptation during which the initial structures of the enzyme and the ligand are modified. Induced fit mechanism. Recently, a great deal of work has been devoted to the study of recognition in more complex systems such as the replication or the translation machinery. Clearly, the extraordinary precision of such systems cannot be explained solely in terms of physical matching between enzymes and their substrates. This has led to a noticeable change of perspective in these areas. As a result of the new kinetic viewpoint, one rather focuses on the time course of the processes, on the kinetic balance between steps of the reaction, on the energy-accuracy relationships, and on the strategies which permit the achievement of high precision using relatively error-prone components in an appropriate dynamic interplay.
