

Qualitative Modes of Inquiry

Barbara A. Artinian

As nurse researchers come to appreciate the complexity of nursing phenomena, the value of exploring the subjective experiences of patients and nurses is being recognized. There is an openness to try out new methodologies, including such qualitative methodologies as ethnography (Pelto & Pelto, 1978), ethnomethodology (Garfinkel, 1967), phenomenology (Schutz, 1967), investigative social research (Douglas, 1976), and grounded theory (Glaser & Strauss, 1967). All these methods use participant observation and in-depth interviewing. However, because the purpose of each methodology differs, so do the methods of data collection and analysis. The purpose of this article is to describe just one of these methodologies—the grounded theory method—and to present a research model that allows researchers to use the grounded theory approach to investigate a new area or to build on the work of previous investigators.

Four qualitative modes of inquiry have been identified, each used for a different purpose and each having the potential for making different contributions to our knowledge of the patient's subjective experience of illness. Two of these, the discovery mode and the emergent fit mode have been described previously (Artinian, 1986). In this article, the relationship of these two modes to two additional modes, the descriptive and intervention modes, will be illustrated to show how a research program can be developed for either individual or group research.

The first mode, the descriptive mode, must precede all the others. This mode is used to present a detailed description of what is happening in some setting or with a particular group of subjects, so that the point of view of the subjects can be understood. The second mode, the discovery mode, builds on the first mode but has the purpose of generating theory. The outcome of the descriptive mode is descriptive narrative, whereas
