

Male Infertility

1 in 8 couples in the U.S. are affected by infertility.¹ Approximately one-third of infertility is attributed to the male partner, one-third is attributed to the female partner and one-third is a combination of problems in both partners or is unexplained.² Male-factor infertility refers to infertility that is caused by the male partner.

What Causes Male Infertility?

Common Causes Include:

Abnormal Morphology refers to physical deformities in the appearance of the sperm. There can be defects on the head, neck/midpiece, as well as the tail. Some examples include being too small, too large, too thick, bent or coiled.

Azoospermia refers to a semen sample without any sperm. This may be the result of a lack of sperm production or it may be that the sperm is not being transported properly. Depending on the cause, treatment options range from medication to minimally invasive procedures.

CBAVD (congenital bilateral absence of the vas deferens) is when the part of the male reproductive system that transports the sperm for ejaculation failed to develop properly prior to birth. If the vas deferens are absent, there may be an opportunity to retrieve sperm from the body surgically. CBAVD accounts for approximately 1-2% of all infertility in men and may be the result of a genetic disease such as cystic fibrosis.

Hypospadias is a congenital condition in which the opening of the urethra is on the underside of the penis instead of at the tip. Surgery, often performed during infancy, is often needed to correct this condition.

Retrograde Ejaculation is a condition where semen travels to and is discharged through the bladder rather than ejaculated from the penis. This condition can often be caused by medications, health conditions such as diabetes, or by surgery that affects the nerves or muscles that control the opening of the bladder. Men with retrograde ejaculation will often have a low volume and sperm count on a semen analysis. Retrograde ejaculation is usually diagnosed with a urinalysis and can often be corrected.

History or Presence of STDs/STIs such as chlamydia and gonorrhea, and infections of the male genitalia and male reproductive system can also cause infertility. These infections are often treatable with medication; however, treatment doesn't always reverse the damage that has already occurred and may affect fertility.

Varicoceles refer to enlarged varicose veins in the scrotum that prevent adequate blood flow or may cause reverse blood flow. Some men with varicoceles have abnormal semen analysis results, including low sperm counts or abnormally shaped sperm. Treatment options may involve surgery.

Diagnosing Male Infertility

A semen analysis will provide information about sperm count, motile sperm count and morphology (or shape). The semen analysis does not indicate sperm function. Depending on the results of testing on the male partner, your reproductive endocrinologist may refer you to a urologist who specializes in male infertility.

Treatment

Medication
There are some medications that can assist with sperm production and may be prescribed by a urologist as part of the overall treatment of male factor infertility.

Intrauterine Insemination (IUI)
The sperm is inserted directly into the female partner's uterus through a catheter during ovulation.

Surgery
Surgery can be used to correct specific issues that could lead to better, more normal sperm quality.

ICSI
Intracytoplasmic sperm injection (ICSI) is a procedure where a single sperm cell is injected directly into the cytoplasm of an egg. This procedure, part of IVF, selects the best sperm and may increase the chance of fertilization in the lab.

TESE/MESA
When there is no sperm in the ejaculate, a minor surgical procedure called a testicular sperm extraction (testicular sperm extraction) can be performed. This procedure, performed by a urologist, removes sperm directly from the testes and makes it available for an IVF cycle.

Donor Sperm
In cases where the sperm count cannot be improved, your fertility doctor may recommend use of a sperm donor in order to conceive. Donors can either be known or anonymous.

Successful Pregnancy is Possible

Although male factor infertility can complicate becoming a parent, those with male infertility can often conceive a child – you may just need the help of a fertility specialist. If you're having issues getting pregnant, make sure both partners are tested for contributing factors. Your reproductive endocrinologist can help plan your best path to parenthood!
