

Planet Mars: Research, Features, Quirks, and Fun Facts

credit: rawpixel.com

Hi, all of you must have learned about the solar system and the names of the planets, this time we will learn about the "Red Planet" or Planet Mars together.

Mars is the fourth planet from the Sun and the **second-smallest planet** in the **Solar System**, being larger than only Mercury. In English, Mars carries the name of the Roman god of war and is often referred to as the "**Red Planet**". The latter refers to the effect of the iron oxide prevalent on Mars's surface, which gives it a reddish appearance distinctive among the astronomical bodies visible to the naked eye. Mars is a terrestrial planet with a thin atmosphere, having surface features reminiscent both of the impact craters of the Moon and the valleys, deserts and polar ice caps of Earth.

Research on Mars

The first spacecraft to fly by Mars was Mariner 4 in 1965. Since then, dozens of spacecraft have been sent to Mars, including orbiters, landers, and rovers. These spacecraft have provided us with a wealth of information about the planet, including its surface features, atmosphere, and interior.

Scientists are particularly interested in whether or not Mars could have once been habitable. There is evidence that Mars once had a thicker atmosphere and liquid water on its surface. If so, it is possible that life could have arisen on Mars. However, there is no definitive evidence of life on Mars yet.
