Beyond Metallocenes Next Generation Polymerization Catalysts:

Beyond Metallocenes Abhimanyu O. Patil, Gregory G. Hlatky, 2003 The past 15 years have witnessed tremendous advances in the design and use of organometallic complexes as precatalysts for olefin polymerization Most recently an intense search has been started in next generation single site catalysts New approaches have been taken to ligand design This research has yielded extraordinary results such as catalysts with activities as high or higher than those of conventional metallocenes stereospecific and living polymerizations and amazing new polymer structures such as highly branched ethylene homopolymers This volume presents some of the recent disclosures in this exciting and rapidly expanding field featuring papers by some of the leading investigators *Handbook of Transition Metal Polymerization Catalysts* Ray Hoff, 2018-04-20 Including recent advances and historically important catalysts this book overviews methods for developing and applying polymerization catalysts dealing with polymerization catalysts that afford commercially acceptable high yields of polymer with respect to catalyst mass or productivity Contains the valuable data needed to reproduce syntheses or use the catalyst for new applications Offers a guide to the design and synthesis of catalysts and their applications in synthesis of polymers Includes the information essential for choosing the appropriate reactions to maximize yield of polymer synthesized Presents new chapters on vanadium catalysts Ziegler catalysts laboratory homopolymerization and copolymerization

Multimodal Polymers with Supported Catalysts Alexandra Romina Albuñia, Floran Prades, Dusan Jeremic, 2019-01-16 This book provides an overview of polyolefine production including several recent breakthrough innovations in the fields of catalysis process technology and materials design The industrial development of polymers is an extraordinary example of multidisciplinary cooperation involving experts from different fields An understanding of structure property and processing relationships leads to the design of materials with innovative performance profiles A comprehensive description of the connection between innovative material performance and multimodal polymer design which incorporates both flexibility and constraints of multimodal processes and catalyst needs is provided This book provides a summary of the polymerization process from the atomistic level to the macroscale process components including catalysts and their influence on final polymer performance This reference merges academic research and industrial knowledge to fill the gaps between academic research and industrial processes Connects innovative material performance to the flexibility of multimodal polymer design processes Provides a comprehensive description of the polymerization process from the atomic level to the macroscale Presents a polyhedral view of multimodal polymer production including structure property and processing relationships and the development of new materials Molecular Materials with Specific Interactions - Modeling and Design W. Andrzej Sokalski, 2007-05-06 Molecular Materials with Specific Interactions Modeling and Design has a very interdisciplinary character and is intended to provide basic information as well as the details of theory and examples of its application to experimentalists and theoreticians interested in modeling molecular properties and putting into practice rational design of

new materials One of the first requirements to initiate the molecular modeling of molecular materials is an accurate and realistic description of the electronic structure intermolecular interactions and chemical reactions at microscopic and macroscopic scale Therefore the first four chapters contain an extensive introduction into the latest theories of intermolecular interactions functional density techniques microscopic and mezosopic modeling techniques as well as first principle molecular dynamics In the following chapters techniques bridging microscopic and mezosopic modeling scales are presented The authors then illustrate various successful applications of molecular design of new materials drugs biocatalysts etc before presenting challenging topics in molecular materials design

Organometallic Reactions and Polymerization Kohtaro Osakada,2014-07-15 This compilation provides advanced graduate students and researchers with a structured overview of olefin polymerization Divided into eight chapters written by international experts this book covers polymerization using various organotransition metal catalysts including early and late transition metal complexes new trends in olefin oligomerization and related reactions All authors address the historic and scientific backgrounds of the field as well as current research progress and potential for further research The complete book is designed to present eight independent lectures and because all authors are well versed in organometallic chemistry each is based on a profound understanding of the reactions and structures of organotransition metal complexes This book is an ideal accompaniment for researchers taking courses in olefin polymerization and also serves as a valuable resource for teachers and lecturers of chemistry when planning and researching material for advanced lecture courses
