Carbonic Anhydrases:

The Carbonic Anhydrases W.R. Chegwidden, N.D. Carter, Y.H. Edwards, 2000-10 Carbonic anhydrase CA is a seemingly ubiquitous enzyme of profound physiological importance which plays essential roles in respiration acid base homeostasis bone resorption calcification photosynthesis several biosynthetic pathways and a variety of processes involving ion gas and fluid transfer This enzyme which is present in at least three gene families has found favour as a model for the study of evolution of gene families and for site directed mutagenesis in structure function relationships for protein folding and for transgenic and gene target studies Since the early use of CA inhibitors as diuretics and in treating congestive heart failure the enzyme has been target of considerable clinical attention Much of this is now focused on endeavours to produce a new generation of such drugs for the effective treatment of glaucoma and other potential applications Recent data suggesting links between CA and various disease processes including cancer have stimulated further

Carbonic Anhydrase Claudiu T. Supuran, Andrea Scozzafava, Janet Conway, 2004-05-27 Carbonic Anhydrase Its Inhibitors and Activators provides a state of the art overview of the latest developments and challenges in carbonic anhydrase research Authors describe the mechanisms of action of specific inhibitors in relation to physiological function and present previously unpublished research on CA activators Written by a team of in

Carbonic Anhydrase: Mechanism, Regulation, Links to Disease, and Industrial Applications Susan C. Frost, Robert McKenna, 2013-10-22 The study of carbonic anhydrase has spanned multiple generations of scientists Carbonic anhydrase was first discovered in 1932 by Meldrum and Roughton Inhibition by

sulfanilamide was shown in 1940 by Mann and Keilin Even Hans Krebs contributed to early studies with a paper in 1948 showing the relationship of 25 different sulfonamides to CA inhibition It was he who pointed out the importance of both the charged and uncharged character of these compounds for physiological experiments The field of study that focuses on carbonic anhydrase CA has exploded in recent years with the identification of new families and isoforms The CAs are metalloenzymes which are comprised of 5 structurally different families the alpha beta gamma and delta and epsilon classes The alpha class is found primarily in animals with several isoforms associated with human disease The beta CAs are expressed primarily in plants and are the most divergent The gamma CAs are the most ancient These are structurally related to the beta CAs but have a mechanism more similar to the alpha CAs The delta CAs are found in marine algae and diflagellates The epsilon class is found in prokaryotes in which it is part of the carboxysome shell perhaps supplying RuBisCO with CO₂ for carbon fixation With the excitement surrounding the discovery of disease related CAs scientists have redoubled their efforts to better understand structure function relationships to design high affinity isotype specific inhibitors and to delineate signaling systems that play regulatory roles over expression and activity We have designed the book to cover basic information of mechanism structure and function of the CA families The authors included in this book bring to light the newest data with regard to the role of CA in physiology and pathology across phylums and in unique environmental niches

The Carbonic Anhydrases S.J. Dodgson,1991-05-31 As we approach the twenty first century the problems of industrialization are evident we find there is a greenhouse effect the ozone layer is being depleted the rain is acidified and there is a terrible problem of increasing CO concentrations in the atmo 2 sphere The carbonic anhydrases are a unique family of enzymes that solve these problems in the human body they are responsible for converting CO a gas to 2 HCO which is the biggest intracellular buffer with a concomitant decrease in a 3 hydroxyl ion Globally the functions of the carbonic anhydrases in photosynthesis in rain forests and in the algae and plankton that cover our oceans indicate that they are also of utmost importance in the maintenance of the acid base balance on our planet Although the whole field of CO metabolism is enormous and still rapidly 2 expanding because of the research interests of the editors this book is mainly concerned with mammalian carbonic anhydrases However if the interested reader intends to purify carbonic anhydrases from nonmammalian sources Dr Cheg widden has provided the necessary information in Chapter 7 The carbonic anhydrases were first discovered in 1933 until1976 there were thought to be only two isozymes Since then CA ill IY V VI and VII have been discovered and well characterized There is of course no reason to believe that we have found them all **Carbonic Anhydrases** Claudiu T. Supuran,Alessio Nocentini,2019-07-17 Carbonic Anhydrases provides an interdisciplinary review of the burgeoning carbonic anhydrase CA research area spanning from CAs classification biochemical and structural features to drug design and pharmacology of CA inhibitors and activators finally touching on the biotechnological applications of these metalloenzymes The book adopts a clear step by step approach and introduction to this intricate and highly interdisciplinary field A diverse

Carbonic Anhydrases and Metabolism Claudiu T. Supuran, 2019-04-08 Carbonic anhydrases CAs EC 4.2.1.1 are metalloenzymes present in all kingdoms of life as they equilibrate the reaction between three simple but essential chemical species CO₂ bicarbonate and protons Discovered more than 80 years ago in 1933 these enzymes have been extensively investigated due to the biomedical application of their inhibitors but also because they are an extraordinary example of convergent evolution with seven genetically distinct CA families that evolved independently in Bacteria Archaea and Eukarya CAs are also among the most efficient enzymes known in nature due to the fact that the uncatalyzed hydration of CO₂ is a very slow process and the physiological demands for its conversion to ionic soluble species is very high Inhibition of the CAs has pharmacological applications in many fields such as antiglaucoma anticonvulsant antiobesity and anticancer agents diagnostic tools but is also emerging for designing anti infectives i e antifungal antibacterial and antiprotozoan agents with a novel mechanism of action Mitochondrial CAs are implicated in de novo lipogenesis and thus selective inhibitors of such enzymes may be useful for the development of new antiobesity drugs As tumor metabolism is diverse compared to that of normal cells ultimately relevant contributions on the role of the tumor associated isoforms CA IX and XII in these phenomena have been published and the two isoforms have been validated as novel antitumor antimetastatic drug targets with antibodies and small molecule inhibitors in various stages of clinical development CAs also play a crucial role in other metabolic processes connected with urea biosynthesis gluconeogenesis and so on since many carboxylation reactions catalyzed by acetyl coenzyme A carboxylase or pyruvate carboxylase use bicarbonate not CO₂ as a substrate In organisms other than mammals e g plants algae and cyanobacteria CAs are involved in photosynthesis whereas in many parasites fungi protozoa they are involved in the de novo synthesis of important metabolites lipids nucleic acids etc The metabolic effects related to interference with CA activity however have been scarcely investigated The present Special Issue of Metabolites aims to fill this gap by presenting the latest developments in the field of CAs and their role in metabolism
