

## Essay about The Physics of Car Collisions

### Basic Concepts

Issac Newton was the first to state the concepts that are necessary to understanding the physics of collisions. His three laws are used again and again in all the fields of physics:

#### Newton's 1st Law

In the absence of external forces, an object at rest remains at rest and an object in motion remains in motion with a constant velocity.

This law can be best observed in space, far from the gravity of a star or planet, where there is no [friction](#) or air resistance. If, in the middle of deep space, you give a rock a little push, it will continue with the direction and velocity you gave it forever. The only way to stop it is to apply a [force](#) in the opposite direction. This law is not intuitive because we are surrounded...[show more content...](#) Every single action has an equal and opposite reaction. If you were standing in the middle of a perfectly slick frozen lake, and needed to get off, you could throw an object away from you. When you applied force to the object you threw, it also applied an equal force pushing you back. You would travel in the opposite direction from the throw, although slower, because you probably have [mass](#) more than the object you threw.

#### Static and Kinetic Friction

Friction is a key concept when you are attempting to understand car accidents. The force of friction is a force that resists motion when two objects are in contact. If you look at the surfaces of all objects, there are tiny bumps and ridges. Those microscopic peaks and valleys catch on one another when two objects are moving past each other.

This explanation is a little simplified. There are other processes at work, including chemical bonding and electrical interactions.

The level of friction that different materials exhibit is measured by the coefficient of friction. The formula is  $\mu = f / N$ , where  $\mu$  is the coefficient of friction,  $f$  is the amount of force that resists motion, and  $N$  is the normal force. Normal force is the force at which one surface is being pushed into another. If a rock that weighs 50 newtons is lying on the ground, then the normal force is that 50 newtons of force. The higher  $\mu$  is, the more force resists motion if two objects are sliding past each
