Optimal Trajectory Tracking of Nonlinear Dynamical Systems Jakob Löber, 2016-12-20 By establishing an alternative foundation of control theory this thesis represents a significant advance in the theory of control systems of interest to a broad range of scientists and engineers While common control strategies for dynamical systems center on the system state as the object to be controlled the approach developed here focuses on the state trajectory The concept of precisely realizable trajectories identifies those trajectories that can be accurately achieved by applying appropriate control signals The resulting simple expressions for the control signal lend themselves to immediate application in science and technology The approach permits the generalization of many well known results from the control theory of linear systems e g the Kalman rank condition to nonlinear systems The relationship between controllability optimal control and trajectory tracking are clarified Furthermore the existence of linear structures underlying nonlinear optimal control is revealed enabling the derivation of exact analytical solutions to an entire class of nonlinear optimal trajectory tracking problems The clear and self contained presentation focuses on a general and mathematically rigorous analysis of controlled dynamical systems The concepts developed are visualized with the help of particular dynamical systems motivated by physics and chemistry

Dynamic Systems El-Kébir Boukas, Roland P. Malhamé, 2005-12-05 Analysis Control and Optimization of Complex Dynamic Systems gathers in a single volume a spectrum of complex dynamic systems related papers written by experts in their fields and strongly representative of current research trends Complex systems present important challenges in great part due to their sheer size which makes it difficult to grasp their dynamic behavior optimize their operations or study their reliability Yet we live in a world where due to increasing inter dependencies and networking of systems complexity has become the norm With this in mind the volume comprises two parts The first part is dedicated to a spectrum of complex problems of decision and control encountered in the area of production and inventory systems The second part is dedicated to large scale or multi agent system problems occurring in other areas of engineering such as telecommunication and electric power networks as well as more generic context

Data-Driven Modeling For Analysis And Control Of Dynamical Systems Damien Gueho, 2022 This dissertation advances the understanding of data driven modeling and delivers tools to pursue the ambition of complete unsupervised identification of dynamical systems From measured data only the proposed framework consists of a series of modules to derive accurate mathematical models for the state prediction of a wide range of linear and nonlinear dynamical systems Identified models are constructed to be of low complexity and amenable for analysis and control This developed framework provides a unified mathematical structure for the identification of nonlinear systems based on the Koopman operator A main contribution of this dissertation is to introduce the concept of time varying Koopman operator for accurate modeling of dynamical systems in a given domain around a reference trajectory Subspace identification methods coupled with sparse approximation techniques deliver accurate models both in the continuous and discrete time domains This allows for perfect reconstruction of several classes of nonlinear dynamical systems from the chaotic behavior of the Lorenz oscillator to identifying the Newton's law of gravitation The connection between the Koopman operator and higher order state transition matrices STMs is explicitly discussed It is shown that subspace methods based on the Koopman operator are able to accurately identify the linear time varying model for the propagation of higher order STMs when polynomial basis are used as lifting functions Such algorithms are validated on a wide range of nonlinear dynamical systems of varying complexity and are proven to be very effective on nonlinear systems of higher dimension where traditional methods either fail or perform poorly Applications include model order reduction in hypersonic aerothermoelasticity and reduced order dynamics in a high dimensional finite element model of the Von Krm n Beam Numerical simulation results confirm better prediction accuracy by several orders of magnitude using this framework Additionally a major objective of this research is to enhance the field of data driven uncertainty quantification for nonlinear dynamical systems Uncertainty propagation through nonlinear dynamics is computationally expensive Conventional approaches focus on finding a reduced order model to alleviate the computational complexity associated with the uncertainty propagation algorithms This dissertation exploits the fact that the moment propagation equations form a linear time varying LTV system and use system

theory to identify this LTV system from data only By estimating and propagating higher order moments of an initial probability density function two new approaches are presented and compared to analytical and quadrature based methods for estimating the uncertainty associated with a system's states In all test cases considered in this dissertation a newly introduced indirect method using a time varying subspace identification technique jointly with a quadrature method achieved the best results This dissertation also extends the Koopman operator theoretic framework for controlled dynamical systems and offers a global overview of bilinear system identification techniques as well as perspectives and advances for bilinear system identification Nonlinear dynamics with a control action are approximated as a bilinear system in a higher dimensional space leading to increased accuracy in the prediction of the system's response In the same context a data driven parameter sensitivity method is developed using bilinear system identification algorithms Finally this dissertation investigates new ways to alleviate the effect of noise in the data leading to new algorithms with data correlations and rank optimization for optimal subspace identification
