**Abstract:** One way to verify the concurrent system is to sort the read and write events and control events in the concurrent system according to the sequence relationship, either in a partial order, or in a strict order. Due to the concurrency of the events and the timing of the written data events, there is an overlap between the events, which requires an interval order for analysis. The order structure of the entire interval order is represented by the start and end sequences, and the order is observed for all equivalent interval orders. Mazurkiewicz traces, Comtraces are hierarchical traces, but neither can describe the interval trace. The petri interval trace with data is the technique to solve the problem in this paper, DPN, the Petri net with data, to describe the interval trace of read and write data. The method used is a BE (Beginnings and Endings) sequence to represent a class of runs based on the interval sequence. The case multi-threaded system represents the interval of writing events, and according to the unfolding of Petri net, the analysis of the running trace involved by read and write data events is successfully analyzed.

## 0. Introduction

In concurrent systems, most behavioral semantics are defined according to total order or stratified step order. If the causal relationship is considered, concurrent history is partial order [1–3] or Mazurkiewicz trace[4]. The Mazurkiewicz trace allows an equivalent single sequence, to represent the entire partial order. Traces provide a simple link between the observational and process semantics of concurrency systems. Another trace Comtraces represents the hierarchical sequence structure by a single step sequence, and its related observations can be obtained as a hierarchical or interval extension of the appropriate partial order[5,6].A sequence of events that contains a causal relationship needs to be represented by a step–by–step sequence, or by a structure using a hierarchical order. An interval order structure is required when modeling the relationship, or when the observation is an interval order. Other relevant observations can be obtained as stratified or interval expansion of appropriate partial order. All observations of causality[7,8] are step sequences, which use stratified order structures. When modeling with the "no later than" relationship or all observations are interval order[9], the interval order structure should be employed to describe the observations.

When studying the behavior patterns of the concurrent system, the read and write data events in the concurrent system are sorted according to the sequence relationship, either in partial orders[10] or in total orders. Because of the concurrency of events[11–13] and the time required to writing events, there will be overlap between events, which requires interval order analysis. For most concurrency models, it is problematic to directly generate
