Schwarz, 1965      *The Embryogenesis of the Human Skull* Robert Shapiro, Franklin Robinson, 1980 Rapidly developing diagnostic and therapeutic methods involving direct contact with the human fetus fetoscopy fetal surgery ultrasonic scanning demand a precise knowledge of normal structural development during gestation Toward achieving that goal of precision Drs Robert Shapiro and Franklin Robinson have created an atlas described by Richard L Sidman as a solid piece of research executed with considerable esthetic as well as scholarly finesse and which will serve as the definitive study on an important aspect of human fetal development The authors have documented the early development of the human skull in terms of gross size shape and the behavior of the individual bones com posing the skull with reference to their ossification centers ossification rates and relationships The data are presented in very high quality photographs and radiographs of the dried skull in several relevant orientations low magnification color photomicrographs of well sectioned and stained

specimens and color photographs of an unusually fine series of transilluminated skulls prepared by the Spalteholz method. Line drawings are also presented to assist in interpretation. The atlas is organized according to gestational age and a tabular summary is given of the 63 specimens ranging in age from ten to forty fetal weeks. This will be the basic normative standard reference for studies on developmental skeletal disorders of the head and neck; it will be useful as well in the study of developmental brain diseases. Radiologists engaged in visualizing the fetus and diagnosing fetal diseases in situ by ultrasound, computerized tomography and other methods will find this an invaluable tool.

**Objectivity** Lorraine Daston, Peter L. Galison, 2021-02-02 Objectivity has a history and it is full of surprises In Objectivity Lorraine Daston and Peter Galison chart the emergence of objectivity in the mid nineteenth century sciences and show how the concept differs from alternatives truth to nature and trained judgment This is a story of lofty epistemic ideals fused with workaday practices in the making of scientific images From the eighteenth through the early twenty first centuries the images that reveal the deepest commitments of the empirical sciences from anatomy to crystallography are those featured in scientific atlases the compendia that teach practitioners of a discipline what is worth looking at and how to look at it Atlas images define the working objects of the sciences of the eye snowflakes galaxies skeletons even elementary particles Galison and Daston use atlas images to uncover a hidden history of scientific objectivity and its rivals Whether an atlas maker idealizes an image to capture the essentials in the name of truth to nature or refuses to erase even the most incidental detail in the name of objectivity or highlights patterns in the name of trained

judgment is a decision enforced by an ethos as well as by an epistemology As Daston and Galison argue atlases shape the subjects as well as the objects of science To pursue objectivity or truth to nature or trained judgment is simultaneously to cultivate a distinctive scientific self wherein knowing and knower converge Moreover the very point at which they visibly converge is in the very act of seeing not as a separate individual but as a member of a particular scientific community Embedded in the atlas image therefore are the traces of consequential choices about knowledge persona and collective sight Objectivity is a book addressed to any one interested in the elusive and crucial notion of objectivity and in what it means to peer into the world scientifically *Brain Warping* Arthur W. Toga,1998-11-17 *Brain Warping* is the premier book in the field of brain mapping to cover the mathematics physics computer science and neurobiological issues related to brain spatial transformation and deformation correction All chapters are organized in a similar fashion covering the history theory and implementation of the specific approach discussed for ease of reading Each chapter also discusses the computer science implementations including descriptions of the programs and computer codes used in its execution Readers of *Brain Warping* will be able to understand all of the approaches currently used in brain mapping incorporating multimodality and multisubject comparisons Key Features The only book of its kind Subject matter is the fastest growing area in the field of brain mapping Presents geometrically based approaches to the field of brain mapping Discusses intensity based approaches to the field of brain mapping **The Embryogenesis of the Human Skull** Robert Shapiro, Franklin L. Robinson, 1980

**Imaging Brain Structure and Function** David Simon Lester, Christian C. Felder, E. Neil Lewis, 1997 The cellular complexity and interconnectivity of the brain demands that new and noninvasive techniques be developed to detect alterations in the brain's function and structure due to neuropathologic processes and neurotoxicity These new brain and CNS imaging techniques are described in this volume of papers by researchers in their respective fields These include fluorescence confocal microscopy NMR imaging and spectroscopy ballistic light scattering atomic force and near field microscopy optical imaging and future imaging computer applications The volume is intended as a guide to both present and future technological developments in the neurosciences and addresses the question of how they will add to understanding the mammalian brain structure and function **Mathematical/computational Strategies for Analyzing 3D Human Brain Image Databases** Paul Matthew Thompson, 1999
