

CONVERGING ON THE EAR

The hearing organ of vertebrates arose from vestibular organs, which contained hundreds of hair cells that could detect very low-frequency physical input, such as head rotation or gravity. Starting around 250 million years ago, the three amniote lineages—lepidosaurs (lizards and snakes), archosaurs (crocodilians and birds), and mammals—separately evolved a tympanic middle ear, followed by evolution of the inner ear, both of which served to increase hearing sensitivity. Despite the independent origin of hearing structures in the three lineages, the outcomes were functionally quite similar, serving as a remarkable example of convergent evolution.

MODERN MIDDLE EAR Arose 250-200 million years ago

In archosaurs and lepidosaurs, a long and thin middle-ear bone called the columella evolved from the hyomandibula, a bone that earlier had formed a large strut connecting the braincase to the outer skull.

In mammals, three bony ossicles evolved from an old jaw joint (malleus, incus) together with the hyomandibula (tapes).

In both cases, the middle-ear bones formed a lever system that greatly magnified sound input.

LEPIDOSAURS

ARCHOSAURS

MAMMALS

MODERN INNER EAR Arose starting about 200 million years ago

In lepidosaurs, the auditory papilla ranges from a few hundred micrometers to 2 millimeters in length and contains two types of hair cells: one with taller bundles and fewer stereocilia that responds to sounds below 1 kHz and another with shorter, thicker bundles that responds to higher-frequency pitches.

The archosaur papilla, which reaches lengths of up to 10 millimeters in some birds, contains many thousands of hair cells of two types: tall hair cells, which serve to detect sound, and short hair cells, which amplify the signal.

In most mammals, the auditory papilla, called the organ of Corti, evolved to be so long that it began to coil on top of itself. The papilla ranges from 1.5 to 4 coils and 7 millimeters (mouse) to 70 millimeters (blue whale) in length. Mammals have two types of hair cells: inner hair cells, which detect sound, and outer hair cells, which amplify it.

In all three lineages, hair cells are arranged along the auditory papilla from low- to high-frequency sensitivity, called a tonotopic organization. In both archosaurs and mammals, one type of hair cell serves to amplify the sound signal received by the other type.
