

Aggregation-Augmented Magnetism of Lanthanide-Doped Nanoparticles and Enabling Magnetic Levitation-Based Exosome Sensing

Yuanyuan Dong, Wei Ren,* Yuanyuan Sun, Xinrui Duan, and Chenghui Liu*

Due to the presence of unpaired electron orbitals in most lanthanide ions, lanthanide-doped nanoparticles (LnNPs) exhibit paramagnetism. However, as to biosensing applications, the magnetism of LnNPs is so weak that can hardly be employed in target separation. Herein, it is discovered that the magnetism of the LnNPs is highly associated with their concentration in a confined space, enabling aggregation-augmented magnetism to make them susceptible to a conventional magnet. Accordingly, a magnetic levitation (Maglev) sensing system is designed, in which the target exosomes can specifically introduce paramagnetic LnNPs to the microbeads' surface, allowing aggregation-augmented magnetism and further leverage the microbeads' levitation height in the Maglev device to indicate the target exosomes' content. It is demonstrated that this Maglev system can precisely distinguish healthy people's blood samples from those of breast cancer patients. This is the first work to report that LnNPs hold great promise in magnetic separation-based biological sample sorting, and the LnNP-permitted Maglev sensing system is proven to be promising for establishing a new generation of biosensing devices.

1. Introduction

Lanthanide-doped nanoparticles (LnNPs) have emerged to be powerful tools in a range of areas because of their exceptional optical properties.^[1] By leveraging their optical signal output in different ways, LnNPs can be used as fluorescent probes in different sensing scenarios.^[2] Considering biosensing applications, magnetic nanoprobe play a critical role because they can label the

target molecules of interest and simultaneously concentrate and separate them from complex biological samples for the convenience of further analysis.^[3] Although some kinds of LnNPs (e.g., Gd-doped ones) are reported to have paramagnetism that originated from the unpaired electrons in the 4f orbitals, there are two major challenges in developing magnetically separable LnNP-based sensing systems.^[4] On the one hand, from the material aspect, the magnetic susceptibility of the Gd-doped nanoparticles (Gd-NPs) is much weaker than conventional magnetic nanoparticles of comparable sizes (e.g., iron oxide nanoparticles).^[5] This means the paramagnetic LnNPs are not directly separable by a magnet. Moreover, although researchers have developed approaches for combining high magnetic strength nanomaterials and LnNPs, it will inevitably lead to complicated nano-fabrication processes and weakened optical performance.^[6] On the

other hand, from the instrumental aspect, even when using magnetic resonance imaging (MRI) technology that can impose magnetic fields up to 9.4 T or even higher, the paramagnetic LnNPs only act as contrast agents without any magnetic separation phenomenon toward target analysis being reported.^[7] However, it is quite challenging to build up ultra-powerful magnetic devices with compact sizes. Therefore, efforts need to be devoted to both nanofabrication and device development to allow for biosensing applications based on the intrinsic paramagnetism of LnNPs.

In this work, we discovered that the magnetic moment of the paramagnetic LnNPs (e.g., Gd-doped ones) is closely related to their aggregation status. That is to say, if Gd-NPs gather into aggregates rather than homogeneously distributed in a good solvent, their magnetic moment can be prominently strengthened. Intriguingly, this can also be achieved if the Gd-NPs are in close proximity in a confined space, for example, being captured on the surface of a microbead. Considering this, a magnetic biosensor can be established if paramagnetic LnNPs can be specifically introduced to the surface of microbeads and a proper sensing device is employed for signal readout. Accordingly, we designed a magnetic levitation (Maglev)-based exosome sensing system by using Gd-NPs as probes. In this design, the target exosomes will specifically introduce the paramagnetic Gd-NPs to the surface
