Coherent Optical Fiber Communications T. Okoshi, K. Kikuchi, 1988-07-31      **An Optical Fiber Communication System Based on Coherent Modulation** Gunnar Jacobsen, TECHNICAL UNIV OF DENMARK LYNGBY INST OF ELECTROMAGNETICS., 1985

Coherent optical communication systems have potential application possibilities which make them a very interesting research area. Compared to present optical communication systems operating at 1.3 micron or 1.55 micron they can operate with 20 dB increase in receiver sensitivity which allows around 100 km increase in repeater separation for point to transmission systems. In addition fully developed coherent systems will allow multiplexing and demultiplexing of several hundreds of information channels all transmitted via just one single mode fiber. Keywords include Coherent optical communications systems, Semiconductor lasers, Frequency stabilisation, Modulation of amplitude, frequency and phase, Injection locking, Single mode optical fibers, Polarisation properties and Dispersion properties.

*Enabling Technologies for High Spectral-efficiency Coherent Optical Communication Networks* Xiang Zhou, Chongjin Xie, 2016-04-29

Enabling Technologies for High Spectral efficiency Coherent Optical Communication Networks. Presents the technological advancements that enable high spectral efficiency and high capacity fiber optic communication systems and networks. This book examines key technology advances in high spectral efficiency fiber optic communication systems and networks enabled by the use of coherent detection and digital signal processing (DSP). The first of this book's 16 chapters is a detailed introduction. Chapter 2 reviews the modulation formats while Chapter 3 focuses on detection and error correction technologies for coherent optical communication systems. Chapters 4 and 5 are devoted to Nyquist WDM and orthogonal frequency division multiplexing (OFDM). In chapter 6 polarization and nonlinear impairments in coherent optical communication systems are discussed. The fiber nonlinear effects in a non dispersion managed system are covered in chapter 7. Chapter 8 describes linear impairment equalization and Chapter 9 discusses various nonlinear mitigation techniques. Signal synchronization is covered in Chapters 10 and 11. Chapter 12 describes the main constraints put on the DSP algorithms by the hardware structure. Chapter 13 addresses the fundamental concepts and recent progress of photonic integration. Optical performance monitoring and elastic optical network technology are the subjects of Chapters 14 and 15. Finally Chapter 16 discusses spatial division multiplexing and MIMO processing technology, a potential solution to solve the capacity limit of single mode fibers. Contains basic theories and up to date technology advancements in each chapter. Describes how capacity approaching coding schemes based on low density parity check (LDPC) and spatially coupled LDPC codes can be constructed by combining iterative demodulation and decoding. Demonstrates that fiber nonlinearities can be accurately described by some analytical models such as GN, EGN model. Presents impairment equalization and mitigation techniques.

**High Spectral Density Optical Communication Technologies** Masataka

Nakazawa, Kazuro Kikuchi, Tetsuya Miyazaki, 2010-08-12 The growth of Internet traffic in recent years surpassed the prediction of one decade ago. Data stream in individual countries already reached terabits level. To cope with the petabit class demands of traffic in coming years, the communication engineers are required to go beyond the incremental improvement of today's technology. A most promising breakthrough would be the introduction of modulation formats enabling higher spectral efficiency than that of binary on-off keying scheme, virtually the global standard of fiber optic communication systems. In wireless communication systems, techniques of high spectral density modulation have been well developed, but the required techniques in optical frequency domain are much more complicated because of the heavier fluctuation levels. Therefore, the past trials of coherent optical modulation/detection schemes were not successful. However, the addition of high-speed digital signal processing technology is the fundamental difference between now and two decades ago, when trials of optical coherent communication systems were investigated very seriously. This approach of digital coherent technology has attracted keen interest among communication specialists, as indicated by the rapid increase in the pioneering presentations at the post-deadline sessions of major international conferences. For example, 32 terabit/s transmission in a fiber experiment based on this technology was reported in the post-deadline session of Optical Fiber Communication Conference (OFC) 2009. The advancement of the digital coherent technologies will inevitably affect the network architecture in terms of the network resource management for the new generation photonic networks rather than will simply provide with huge transmission capacity.

From foundational principles to experimental validations, this book bridges theoretical concepts with practical implementations, offering a holistic view of scalable solutions for next-generation optical networks. Delving into both established and emerging paradigms, this book develops the key technology of improving the capacity of the transmission. It covers hybrid concatenated coding schemes, multi-carrier generation, or multi-band transmission in achieving terabit-scale throughputs. This book also examines the role of self-heterodyne coherent systems, SDM transmission system, and the channel.
