Difficult Decisions in Thoracic Surgery Mark K. Ferguson,2007-03-12 Why do thoracic surgeons need training in decision making Many of us who have weathered

harrowing residencies in surgery feel that after such experiences decision making is a natural extension of our selves While this is no doubt true correct decision making is something that many of us have yet to master The impetus to develop a text on evidence based decision making in thoracic surgery was stimulated by a conference for cardiothoracic surgical trainees developed in 2004 and sponsored by the American College of Chest Physicians During that conference it became clear that we as thoracic surgeons are operating from a very limited fund of true evidence based information What was also clear was the fact that many of the decisions we make in our everyday practices are not only uninformed by evidence based medicine but often are contradictory to existing guidelines or evidence based recommendations The objectives of this book are to explain the process of decision making both on the part of the physician and on the part of the patient and to discuss specific clinical problems in thoracic surgery and provide recommendations regarding their management using evidence based methodology Producing a text that will purportedly guide experienced practicing surgeons in the decision making process that they are accustomed to observe on a daily basis is a daunting task

Differential Diagnosis in Neuro-oncology Jerzy Hildebrand, Michael Brada, 2001 Most neurological lesions in cancer patients are progressive have a profound influence on the quality of life and are life threatening Management of the situation requires rapid identification of the nature and location of the problem as the treatment outcome depends as much on the speed of diagnosis as on the subsequent therapy While modern neuroimages provides invaluable clues to the diagnosis they need to be interpreted in the light of clinical data The clinical examination remains the cornerstone of the differential diagnosis of neurological lesions affecting the cancer patient Neurological disorders are a consequence not only of primary tumours of the central and peripheral nervous system but also of systemic malignancy One in five patients with disseminated malignancy develop neurological complications other than neurogenic pain The majority of neurological problems are a direct consequence of metastatic disease or the result of metabolic disorders however some disorders are due to anti neoplastic treatments or the administration of drugs The incidence of CNS infections and vascular lesions is also increased in malignant disease and a small proportion of neurological disorders are paraneoplastic resulting from a remote effect of cancer on the nervous system This book written by a neurologist and an oncologist aims to help the clinician to identify and locate the underlying neurological lesion in a cancer patient and to make a quick therapeutic decision Diagnostic and therapeutic algorithms are included with an emphasis on the more common and potentially treatable conditions It should be read by neuro oncologists medical oncologists radiation therapists neurosurgeons and all those involved in the management of cancer patients
