## Coexistence And Persistence Of Strange Attractors:

**Coexistence and Persistence of Strange Attractors** Antonio Pumarino, Angel J. Rodriguez, 2014-01-15 Coexistence and Persistence of Strange Attractors Antonio Pumarino, Angel J. Rodriguez, 2006-11-13 Although chaotic behaviour had often been observed numerically earlier the first mathematical proof of the existence with positive probability persistence of strange attractors was given by Benedicks and Carleson for the Henon family at the beginning of 1990 s Later Mora and Viana demonstrated that a strange attractor is also persistent in generic one parameter families of diffeomorphisms on a surface which unfolds homoclinic tangency This book is about the persistence of any number of strange attractors in saddle focus connections The coexistence and persistence of any number of strange attractors in a simple three dimensional scenario are proved as well as the fact that infinitely many of them exist simultaneously **Handbook of Dynamical Systems** H. Broer, F. Takens, B. Hasselblatt, 2010-11-10 In this volume the authors present a collection of surveys on various aspects of the theory of bifurcations of differentiable dynamical systems and related topics By selecting these subjects they focus on those developments from which research will be active in the coming years The surveys are intended to educate the reader on the recent literature on the following subjects transversality and generic properties like the various forms of the so called Kupka Smale theorem the Closing Lemma and generic local bifurcations of functions so called catastrophe theory and generic local bifurcations in 1 parameter families of dynamical systems and notions of structural stability and moduli Covers recent literature on various topics related to the theory of bifurcations of differentiable dynamical systems Highlights developments that are the foundation for future research in this field Provides material in the form of surveys which are important tools for introducing the bifurcations of differentiable dynamical systems *Dynamics Beyond Uniform Hyperbolicity* Christian Bonatti, Lorenzo J. Díaz, Marcelo Viana, 2004-09-30 The notion of uniform hyperbolicity introduced by Steve Smale in the early sixties unified important developments and led to a remarkably successful theory for a large class of systems uniformly hyperbolic systems often exhibit complicated evolution which nevertheless is now rather well understood both geometrically and statistically Another revolution has been taking place in the last couple of decades as one tries to build a global theory for most dynamical systems recovering as much as possible of the conclusions of the uniformly hyperbolic case in great generality This book aims to put such recent developments in a unified perspective and to point out open problems and likely directions for further progress It is aimed at researchers both young and senior willing to get a quick yet broad view of this part of dynamics Main ideas methods and results are discussed at variable degrees of depth with references to the original works for details and complementary information *The Mathematics of the Uncertain* Eduardo Gil, Eva Gil, Juan Gil, María Ángeles Gil, 2018-02-28 This book is a tribute to Professor Pedro Gil who created the Department of Statistics OR and TM at the University of Oviedo and a former President of the Spanish Society of Statistics and OR SEIO In more than eighty original contributions it illustrates the extent to which Mathematics can help manage uncertainty a factor

that is inherent to real life Today it goes without saying that in order to model experiments and systems and to analyze related outcomes and data it is necessary to consider formal ideas and develop scientific approaches and techniques for dealing with uncertainty Mathematics is crucial in this endeavor as this book demonstrates As Professor Pedro Gil highlighted twenty years ago there are several well known mathematical branches for this purpose including Mathematics of chance Probability and Statistics Mathematics of communication Information Theory and Mathematics of imprecision Fuzzy Sets Theory and others These branches often intertwine since different sources of uncertainty can coexist and they are not exhaustive While most of the papers presented here address the three aforementioned fields some hail from other Mathematical disciplines such as Operations Research others in turn put the spotlight on real world studies and applications The intended audience of this book is mainly statisticians mathematicians and computer scientists but practitioners in these areas will certainly also find the book a very interesting read Discrete and Continuous Dynamical Systems ,2008

**Bifurcation and Chaos in Complex Systems** ,2006-06-30 The book presents the recent achievements on bifurcation studies of nonlinear dynamical systems The contributing authors of the book are all distinguished researchers in this interesting subject area The first two chapters deal with the fundamental theoretical issues of bifurcation analysis in smooth and non smooth dynamical systems The cell mapping methods are presented for global bifurcations in stochastic and deterministic nonlinear dynamical systems in the third chapter The fourth chapter studies bifurcations and chaos in time varying parametrically excited nonlinear dynamical systems The fifth chapter presents bifurcation analyses of modal interactions in distributed nonlinear dynamical systems of circular thin von Karman plates The theories methods and results presented in this book are of great interest to scientists and engineers in a wide range of disciplines This book can be adopted as references for mathematicians scientists engineers and graduate students conducting research in nonlinear dynamical systems New Views for Difficult Problems Novel Ideas and Concepts Hilbert s 16th Problem Normal Forms in Polynomial Hamiltonian Systems Grazing Flow in Non smooth Dynamical Systems Stochastic and Fuzzy Nonlinear Dynamical Systems Fuzzy Bifurcation Parametrical Nonlinear Systems Mode Interactions in nonlinear dynamical systems

*Competition and Coexistence* Ulrich Sommer,Boris Worm,2012-12-06 The question Why are there so many species has puzzled ecologist for a long time Initially an academic question it has gained practical interest by the recent awareness of global biodiversity loss Species diversity in local ecosystems has always been discussed in relation to the problem of competitive exclusion and the apparent contradiction between the competitive exclusion principle and the overwhelming richness of species found in nature Competition as a mechanism structuring ecological communities has never been uncontroversial Not only its importance but even its existence have been debated On the one extreme some ecologists have taken competition for granted and have used it as an explanation by default if the distribution of a species was more restricted than could be explained by physiology and dispersal history For decades competition has been a core mechanism behind popular concepts

like ecological niche succession limiting similarity and character displacement among others For some competition has almost become synonymous with the Darwinian struggle for existence although simple plausibility should tell us that organisms have to struggle against much more than competitors e g predators parasites pathogens and environmental harshness

**Nonlinearity** ,2008-05      **Tomita-Takesaki Theory in Algebras of Unbounded Operators** Atsushi Inoue,1998-11-18 These notes are devoted to a systematic study of developing the Tomita Takesaki theory for von Neumann algebras in unbounded operator algebras called O algebras and to its applications to quantum physics The notions of standard generalized vectors and standard weights for an O algebra are introduced and they lead to a Tomita Takesaki theory of modular automorphisms The Tomita Takesaki theory in O algebras is applied to quantum moment problem quantum statistical mechanics and the Wightman quantum field theory This will be of interest to graduate students and researchers in the field of unbounded operator algebras and mathematical physics

*Spatiotemporal Models of Population and Community Dynamics* T. Czaran,1998 This book presents a comprehensive typology and a comprehensible description of spatiotemporal models used in population dynamics The main types included are reaction diffusion systems patch models matapopulation approaches host parasitoid models cellular automata interacting particle systems tessellations and distance models The models are introduced through examples and with informative verbal explanations to help understanding Some of the cellular automation examples are models not yet published elsewhere Possible extensions of certain model types are suggested

**Continuous Strong Markov Processes in Dimension One** Sigurd Assing,Wolfgang Schmidt,1998-05-20 The book presents an in depth study of arbitrary one dimensional continuous strong Markov processes using methods of stochastic calculus Departing from the classical approaches a unified investigation of regular as well as arbitrary non regular diffusions is provided A general construction method for such processes based on a generalization of the concept of a perfect additive functional is developed The intrinsic decomposition of a continuous strong Markov semimartingale is discovered The book also investigates relations to stochastic differential equations and fundamental examples of irregular diffusions

**Probability Theory of Classical Euclidean Optimization Problems** Joseph Yukich,1998-03-18 This monograph describes the stochastic behavior of the solutions to the classic problems of Euclidean combinatorial optimization computational geometry and operations research Using two sided additivity and isoperimetry it formulates general methods describing the total edge length of random graphs in Euclidean space The approach furnishes strong laws of large numbers large deviations and rates of convergence for solutions to the random versions of various classic optimization problems including the traveling salesman minimal spanning tree minimal matching minimal triangulation two factor and k median problems Essentially self contained this monograph may be read by probabilists combinatorialists graph theorists and theoretical computer scientists

**Markov Set-Chains** D. J. Hartfiel,1998-08-20 This volume contains recent information on

topics of fundamental importance in comparative endocrinology and reproduction It comprises 35 chapters on the following topics hypothalamus and pituitary gonads and reproduction pineal gland hormones and general metabolism The book will be a valuable source of recent information and reference for students teachers and scientists engaged in teaching and research in comparative endocrinology and reproduction

**Patterns, Information And Chaos In Neuronal Systems** Gunther Balz,D Chen,Kathy Eastman,Howard S Hock,H J Mackey,John S Nicolis,Gregor Schoner,Audrey A Voss,Bruce J West,1993-06-07 This is the second volume in a series intended to give clear expositions of the applications of the new techniques developed to understand nonlinear phenomena in the life sciences The first paper by West Mackey and Chen is methodological in nature and reviews how to distinguish between noise in biomedical data sets and irregularities generated by deterministic dynamical equations The second paper by Hock Sch ner Balz Eastman and Voss addresses the problem of pattern formation and pattern change in the vision system The authors emphasize the experimental correspondence between quantifiable perceptual phenomena and certain features of nonlinear dynamical systems theory The paper by Chay focuses on modeling strategies for biological phenomena that manifest strong nonlinear behavior Biological rhythms and electrical bursting phenomena are discussed in detail and certain apparently random processes are shown to be describable by chaos The final paper is an attempt by Nicolis and Katsikas to use nonlinear dynamics systems theory to develop a general theory of linguistics The concepts of information and pattern recognition are used in concert with that of a dynamic attractor to argue for the general properties of a cognitive processor

*Galois Theory of Difference Equations* Marius van der Put,Michael F. Singer,1997-09-18 This book lays the algebraic foundations of a Galois theory of linear difference equations and shows its relationship to the analytic problem of finding meromorphic functions asymptotic to formal solutions of difference equations Classically this latter question was attacked by Birkhoff and Tritzinsky and the present work corrects and greatly generalizes their contributions In addition results are presented concerning the inverse problem in Galois theory effective computation of Galois groups algebraic properties of sequences phenomena in positive characteristics and  $q$  difference equations The book is aimed at advanced graduate researchers and researchers

Operator Algebras Generated by Commuting Projections: A Vector Measure Approach Werner Ricker,1999-09-17 This book presents a systematic investigation of the theory of those commutative unital subalgebras of bounded linear operators acting in a Banach space which are closed for some given topology and are generated by a uniformly bounded Boolean algebra of projections One of the main aims is to employ the methods of vector measures and integration as a unifying theme throughout This yields proofs of several classical results which are quite different to the classical ones This book is directed to both those wishing to learn this topic for the first time and to current experts in the field
